About PIRLS 2021

Successfully conducted in 57 countries and eight benchmarking entities, PIRLS 2021 differs from previous PIRLS assessments in several ways. First, a substantial creative effort was focused on transitioning PIRLS 2021 to an innovative digital assessment with 23 colorful and engaging texts delivered to students using a new group adaptive design. Second, PIRLS 2021 data collection occurred over two years during the unprecedented COVID-19 pandemic. Although collecting data in schools faced many disruptions, most countries met the standards for high-quality data collection. This tremendous effort resulted in PIRLS 2021 providing the only internationally comparative fourth grade achievement results collected during the pandemic.

Overview of PIRLS

IEA's PIRLS (Progress in International Reading Literacy Study) is an ongoing international assessment program of students' reading achievement in their fourth year of schooling—an important transition point in their development as readers. By this time in their education, students typically have learned how to read and are now reading to learn. Conducted every five years since 2001, PIRLS is recognized as the global standard for assessing trends in reading achievement at the fourth grade. PIRLS 2021 was the fifth assessment cycle, providing 20 years of trend results.

PIRLS and TIMSS are directed by IEA's TIMSS & PIRLS International Study Center at Boston College in close cooperation with the IEA Amsterdam and IEA Hamburg offices. IEA is an independent international cooperative of national research institutions and government agencies that pioneered international assessments of student achievement in the 1960s to gain a deeper understanding of policy effects across countries' different education systems. IEA has been conducting international assessments of reading literacy and the factors associated with proficient reading comprehension in countries around the world for about 60 years.

Transitioning to Digital Assessment in PIRLS 2021

While ensuring a solid basis for trend comparisons over time, PIRLS continuously evolves with each cycle by capitalizing on advances in technology and measurement methodology to improve the assessments. Simultaneously, PIRLS pioneers new approaches to reading assessment as the internet's ever-increasing pace of

information growth constantly changes the nature of reading comprehension to encompass new online reading literacy skills.

PIRLS 2021 incorporated two major advances in international reading assessment at the fourth grade:

- Transitioned to digital assessment (discussed here)
- Implemented a group adaptive design (see later section [Implementing the Group Adaptive Design in PIRLS 2021](#)).

In a digital assessment, measurement can be improved through more engaging and interactive assessment materials and procedures. Aside from the advantages of a more interactive assessment, activities related to operational procedures (e.g., the digital equivalents of printing and sending materials to schools) can be accomplished with even greater consistency and efficiency once the move to digital assessments has been accomplished.

PIRLS 2021 developed a state-of-the-art user interface for the digital assessment where students can freely navigate through the texts and activate a panel that presents the items (see [The Amazing Octopus](#) and [The Empty Pot](#)). In addition to incorporating texts with interactive features, the digital assessment included innovative ePIRLS tasks (see [Oceans](#)) as a continuation of the groundbreaking work begun in 2016 to assess reading comprehension in a simulated online environment. The PIRLS 2021 digital assessment systems included capabilities for text and item translation and localization, test delivery (formerly printing), administration to students, and data delivery for scoring.

In PIRLS 2021, 26 countries and 7 benchmarking entities transitioned to digital assessment as their primary mode of data collection, while also administering the paper-based trend texts replicated from PIRLS 2016 to a “bridge” sample. The United States administered the PIRLS 2021 digital assessment and the PIRLS 2021 paper bridge assessment. The United States opted to report the paper bridge scores. The other 31 countries and 1 benchmarking entity continued to administer the full assessment using paper booklets.

Exhibit 1 provides a list of the PIRLS 2021 participants and indicates whether their results are based on digital or paper data. Altogether, there were 57 countries in PIRLS 2021, including some distinct education systems within countries that have always participated separately throughout IEA’s long history (e.g., the French- and Dutch-speaking parts of Belgium as well as Hong Kong SAR). In addition, PIRLS 2021 included 8 benchmarking participants, mainly regions of countries that also participated in PIRLS.

* Insufficient data to report results

The PIRLS 2021 Reading Assessment Framework

PIRLS 2021 assessed reading comprehension in accordance with the PIRLS 2021 Reading Assessment Framework (Chapter 1 in [PIRLS 2021 Assessment Frameworks](#)). The PIRLS reading assessment framework has been updated with each cycle to keep reading research and education developments at the forefront through reviews by the PIRLS Reading Development Group (RDG) and the National Research Coordinators (NRCs). This maintains PIRLS' relevance and importance for teaching practice and policy. However, PIRLS is a trend study and the framework's underlying organization has remained consistent across cycles.

The framework is organized around two overarching purposes for reading: reading for literary experience and reading to acquire and use information. The framework also includes four cross-cutting reading comprehension processes: focus on and retrieve explicitly stated information, make straightforward inferences, interpret and integrate ideas and information, and evaluate and critique content and textual elements.

The PIRLS 2021 Reading Assessment Framework provides information that emphasizes the growing importance of ePIRLS, the world leading assessment of online reading that was successfully launched in 14 countries in 2016 (see [ePIRLS 2016 International Results in Online Informational Reading](#)). In the ePIRLS tasks, a teacher avatar guides the students through several simulated multi-modal websites with multiple texts and interactive features to complete school-like assignments about social studies or science topics.

Implementing the Group Adaptive Design in PIRLS 2021

The PIRLS 2021 group adaptive design provides better measurement through better alignment across countries between the assessment difficulty and the students' levels of reading achievement. The group adaptive design is based on texts and items of three levels of difficulty—difficult, medium, and easy—that are combined into booklets of two difficulty levels (see Chapter 3 of the [PIRLS 2021 Assessment Frameworks](#)). The more difficult booklets include difficult and medium texts and items, and the less difficult booklets include easy and medium texts and items. All booklets are administered in each country, but countries whose students have higher reading achievement on average may give the more difficult booklets to a higher percentage of students (70%), and countries whose students have lower average reading achievement may give a higher percentage of their students the less difficult booklets.

Transitioning to the PIRLS 2021 group adaptive design from PIRLS 2016 was a great success because trend blocks could be categorized as easy, medium, or difficult blocks based on data from 2016. The PIRLS 2016 design linked PIRLS blocks of passages and items with less difficult PIRLS Literacy blocks through blocks common to both assessments (see Chapter 3 of [PIRLS 2016 Assessment Frameworks](#)). For 2021, PIRLS Literacy blocks contributed content at the “easy” level, the blocks common to both PIRLS and PIRLS Literacy contributed content at the “medium” level, and the PIRLS blocks contributed content at the “difficult” level. Including the newly developed blocks for 2021, the group adaptive design in PIRLS 2021 led to a lower item non-response rate and more precise achievement estimates than the non-adaptive design in PIRLS 2016 (see Chapter 9 in [Methods and Procedures: PIRLS 2021 Technical Report](#)).

Providing comprehensive coverage of the PIRLS 2021 Reading Assessment Framework and implementing the group adaptive design resulted in the most comprehensive and complex international reading assessment to date, consisting of 18 text and item sets as well as 5 ePIRLS tasks. Exhibit 2 shows the PIRLS 2021 group adaptive design for the 18 text and item sets, where 9 text and item sets assessed the literary reading purpose, and 9 text and item sets assessed the informational reading purpose. In accordance with the group adaptive design, within the 9 text and item sets for each purpose, 3 text and item sets were difficult, 3 were medium, and 3 were easy.

Exhibit 2: PIRLS 2021 Group Adaptive Assessment Design

Reading Purpose	Difficulty Level	Text Name*
Literary Experience	Difficult	Shiny Straw (06)
		Oliver and The Griffin (16)
		Ink Drinker (21)
	Medium	The Empty Pot (11)
		Pemba Sherpa (16)
		Ostrich and the Hat (21)
	Easy	The Summer My Father Was 10 (11)
		Library Mouse (16)
		Learning a New Language (21)
Acquire and Use Information	Difficult	Where's the Honey? (11)
		Icelandic Horses (16)
		World's Bank for Seeds (21)
	Medium	Sharks (06)
		How Did We Learn to Fly? (16)
		Marie Curie Prize-Winning Scientist (21)
	Easy	Training A Deaf Polar Bear (11)
		Hungry Plant (16)
		The Amazing Octopus (21)

* Number in parentheses indicates the assessment year in which the passage was first introduced.

Downloaded from <https://pirls2021.org/results>

Developing the new text and item sets for the PIRLS 2021 assessment was a considerable effort. Six new text and item sets were needed to complete the new group adaptive design requirements. To ensure all target levels were successfully met, twice as many—12 text and items sets—were developed for the field test. Also, two ePIRLS tasks were published on the [PIRLS 2016 website](#), so two new tasks for PIRLS 2021 were developed to replace them.

The field test development took nearly two years, including two RDG meetings and three NRC meetings, with one of the NRC meetings specifically devoted to item development. At the NRC item development meeting hosted by Chinese Taipei, 126 representatives from 43 countries drafted more than 600 items.

Despite the initial emergence of COVID-19 in 2020 at the time scheduled for the field test, more than half the countries were able to collect field test data. Therefore, following the field test, the field test data were analyzed, PIRLS 2021 materials were selected, finalized, and assembled, and the countries continued preparations for the PIRLS 2021 main data collection.

PIRLS 2021 Data Collection Successful Despite Disruptions by the COVID-19 Pandemic

PIRLS 2021 is the only international assessment of educational achievement that successfully collected data during COVID-19's disruption in students' schooling. Consequently, the [PIRLS 2021 International Database](#) provides an extremely rich and valuable data source to research the impact of COVID-19 on teaching and learning reading.

Similar to previous PIRLS assessments, to prepare for PIRLS 2021, the TIMSS & PIRLS International Study Center, IEA Hamburg, and Statistics Canada worked to select a carefully designed random sample of schools within each country and trained countries in data collection procedures designed to yield high quality data. However, as it is well known, many schools around the world faced considerable disruptions to their operations due to COVID-19, with a good number shifting to remote learning or reduced classroom sizes. Even school buildings that remained open often adopted special procedures and often reduced access to prevent the spread of COVID-19.

PIRLS adapted rapidly to the situation and included context questionnaire items specifically targeted to collect information about the challenges faced by the PIRLS 2021 schools and students during COVID-19. The PIRLS 2021 Context Questionnaires can be accessed on the [PIRLS 2021 website](#). Also, the [PIRLS 2021 Encyclopedia](#), which includes a chapter authored by each country describing its

reading education, provides information from most countries about how COVID-19 interrupted teaching and learning.

School Operations

At the time of the PIRLS 2021 data collection, there was considerable variation across countries in how primary school operations were affected by the COVID-19 pandemic, with some countries still experiencing school closures and others modifying how they provided in-person instruction.

Exhibit 3 shows the percentages of students in the PIRLS 2021 countries by the number of weeks their principals reported that normal primary school operations were affected by the COVID-19 pandemic. Because principals in the countries with delayed assessments (see Exhibit 5) needed to recall what happened six months previously in the prior 2020-2021 school year to answer the question, the rows for those countries are colored pink. This color coding to distinguish the results based on delayed data collection is also used in subsequent exhibits.

On average, across countries, only 14 percent of the fourth grade students attended schools where normal operations were “not affected” by the COVID-19 pandemic during the 2020-2021 school year. In contrast, 47 percent attended schools where normal operations were affected by the COVID-19 pandemic for “more than 8 weeks” of instruction. The remaining students experienced more moderate disruptions; 10 percent of students attended schools where “less than 2 weeks” of instruction were affected by the COVID-19 pandemic, 15 percent where “2 to 4 weeks” of instruction were affected, and 13 percent where “5 to 8 weeks” of instruction were affected.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least 70% but less than 85% of the students.

An "s" indicates data are available for at least 50% but less than 70% of the students.

A tilde (~) indicates insufficient data to report result. A dash (-) indicates comparable data not available.

* In Singapore, all primary schools were closed for a total of 4 weeks, during which all students shifted to full home-based learning, followed by fourth grade students alternating between home-based learning and returning to school for lessons on a weekly basis for 4 weeks. See *PIRLS 2021 Encyclopedia* for more details.

Exhibit 3: Weeks of Normal Primary School Operations Affected by the COVID-19 Pandemic*Students' Results based on Principals' Reports***About the Item**

Please estimate the number of weeks during the current academic year where normal primary school operations have been affected by the COVID-19 pandemic.

- Normal primary school operations have not
been affected by the COVID-19 pandemic -----
- Less than two weeks of instruction -----
- Two to four weeks of instruction -----
- Five weeks to eight weeks of instruction -----
- More than eight weeks of instruction -----

Parents' Perceptions

Exhibit 4 shows parents' reports of whether or not their child stayed home from school because of the COVID-19 pandemic and their perceptions of the pandemic's effect on their child's learning progress. Information was collected using two items in the PIRLS 2021 Home Questionnaire (see "About the Items"). If parents reported that their child did not stay home from school because of the COVID-19 pandemic, they were not asked to respond to the item about perceptions of their child's learning progress.

Internationally, parents of most students (86%) reported that their child stayed home from school because of the COVID-19 pandemic, with the rest reporting their child did not stay home due to the pandemic (14%) and consequently not being asked any further questions.

Across countries, on average, parents of two-thirds of the students (67%) reported that their child stayed home and that their child's learning progress was adversely affected by the pandemic—either "a lot" (22%) or "somewhat" (45%). Parents of 19 percent of the students reported that their child stayed home from school because of the COVID-19 pandemic, but their child's learning progress was "not at all" affected.

Exhibit 4: Parents' Perceptions of Their Child's Learning Progress During the COVID-19 Pandemic

* If students' parents answered "No" that their child did not stay home from school at any time during the COVID-19 pandemic, the question about perceptions of their child's learning progress was considered "logically not applicable."

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least 70% but less than 85% of the students.

An "s" indicates data are available for at least 50% but less than 70% of the students.

An "x" indicates data are available for at least 40% but less than 50% of the students—interpret with caution.

A "y" indicates data are available for less than 40% of the students.

A tilde (~) indicates insufficient data to report result. A dash (-) indicates comparable data not available.

Exhibit 4: Parents' Perceptions of Their Child's Learning Progress During the COVID-19 Pandemic*Students' Results based on Parents' Reports*

About the Items

Did your child stay home at any time because of the COVID-19 pandemic?

Yes ----

No ----

(If No, thank you for completing this questionnaire)

Do you think your child's learning progress has been adversely affected?

A lot ----

Somewhat ----

Not at all ----

SOURCE: IEA's Progress in International Reading Literacy Study - PIRLS 2021
Downloaded from <https://pirls2021.org/results>

Despite the many challenges of conducting a school-based assessment during the COVID-19 pandemic, countries remained committed to participating in PIRLS 2021. Due to the tremendous efforts from all involved, the PIRLS 2021 countries overcame a variety of obstacles to ensure that students could take the PIRLS 2021 assessment. In all, PIRLS 2021 assessed nearly 400,000 students.

As shown in Exhibit 5, most of the countries managed to collect data towards the end of students' fourth year of schooling according to the original PIRLS 2021 schedule, which was October to December 2020 for Southern Hemisphere countries and February to July 2021 for Northern Hemisphere countries. However, some Northern Hemisphere countries had to delay assessing the cohort of fourth grade students until the beginning of the fifth grade (September to December 2021) and some countries assessed their fourth grade students one year later than originally scheduled (August to December 2021 for the Southern Hemisphere and April to July 2022 for the Northern Hemisphere).

Across the data collection dates, most of the countries assessed fourth grade students toward the end of the school year. The exception is the 14 Northern Hemisphere countries that necessarily had to delay testing and assessed students at the beginning of the fifth grade. For the most part, the students were from the same schools that had been selected for PIRLS 2021, but because of the delay over the summer months the students were 6 months older on average than their PIRLS 2016 counterparts (see later section on [Reporting the PIRLS 2021 Achievement Results](#)).

Numbers of Students Assessed

Nationally representative random samples of approximately 4,000 students from 150 to 200 schools participated in PIRLS 2021. PIRLS 2021 collected data from about 400,000 students, 380,000 parents, 20,000 teachers, and 13,000 schools.

A rigorous sampling adjudication provided documentation that almost all the countries met all sampling standards. Of the 57 countries and 8 benchmarking participants, nearly all the countries met the guidelines for coverage of the target population and most met the standards for low exclusion rates (less than 5%). Almost all the countries met or exceeded the school and student participation rate requirements, with only 7 needing to rely on replacement schools to reach the requirement and 4 falling short of the requirements.

In summary, the PIRLS 2021 data are of high quality. It can be said that the pandemic affected almost all countries to some extent, and no assessment can provide data on how students would have performed without COVID-19 affecting schools. No assessment, including PIRLS 2021, can be designed to measure the effects of the COVID-19 pandemic on student achievement and to compare achievement with and without the pandemic. However, PIRLS 2021 provides a unique data source for studying students' reading achievement and learning experiences around the world during the pandemic.

Summary of Scaling the PIRLS 2021 Data

For more detailed information about scaling the PIRLS 2021 achievement data and links to other references about the methodology, see Chapter 10 (methodology) and Chapter 11 (implementation) in [*Methods and Procedures: PIRLS 2021 Technical Report*](#).

PIRLS has used well-established psychometric scaling approaches to derive achievement distributions and transform the assessment results of each PIRLS data collection to the PIRLS trend scale. Among these methods, linear scale transformations and linking designs using randomly equivalent samples have been used extensively in past PIRLS cycles for analysis and reporting (described in Chapter 10 of [*Methods and Procedures: PIRLS 2021 Technical Report*](#)). With the transition to the digital environment in PIRLS 2021, it was necessary to adapt analytic procedures and data collection designs to accommodate the change from paper-and-pencil to digital assessment. Accordingly, countries that administered the PIRLS digital assessment implemented a data collection design that involved two student samples: the main sample of about 4,500 students and a second equivalent but smaller “bridge” sample (about 1,500 students). Students in the main sample took

the 2021 digital assessment, while the bridge sample was administered the PIRLS 2021 trend items in the PIRLS 2016 paper format. This resulted in equivalent samples of students in each country responding to the trend items in the paper and digital formats, which enabled bridging the trend scale from paper-based PIRLS 2016 to digitally-based PIRLS in 2021. Although the bridge samples were smaller than the digital samples, often the students were in the same schools as those who took the digital assessments. The bridge samples were adjudicated as part of the same process used for all PIRLS 2021 countries and were judged to be the same quality as their digital counterparts.

To ensure that the paper-based and digitally-based assessment results will be reported on the PIRLS trend scale, scaling the PIRLS 2021 data involved the following three steps. First, the usual concurrent calibration approach (described in Chapter 11 of [Methods and Procedures: PIRLS 2021 Technical Report](#)) was applied to the paper-based data from PIRLS 2016 and PIRLS 2021, ensuring that the PIRLS 2021 paper data was linked to the PIRLS trend scale. This procedure included all the data from trend countries that administered the paper-based PIRLS 2021 assessment as well as the paper-based bridge data from the digital countries. Second, the digital assessment data from the digital countries was linked to the PIRLS trend scale through population-based linking, which capitalizes on the availability of equivalent samples from the same populations between the digital and bridge samples. Finally, the data from the digital countries, including data from the ePIRLS items, were scaled together to link the ePIRLS data to the PIRLS achievement scale.

Reporting the PIRLS 2021 Achievement Results

Reading achievement results are included in *PIRLS 2021 International Results in Reading* for all 57 countries and 8 benchmarking entities that participated in PIRLS 2021. Concerns about the comparability of the data resulting from COVID-19 school disruptions and delayed testing complicated reporting the PIRLS 2021 results.

PIRLS and TIMSS have built a reputation for reporting high quality data, but not all data collected meet the expected guidelines. In such cases, PIRLS and TIMSS use annotations to identify results based on data that for some reason fell short of meeting the expected guidelines. The goal is to be clear about issues while still reporting countries' data. See discussion "Impacts of Modifying the Assessment Schedule on Students' Achievement" in [Countries' Reading Achievement](#).

The achievement results for all countries that assessed fourth grade students at the end of the school year are presented according to average achievement in Exhibit 1.1, with the countries that assessed the fourth grade students one year later

annotated. Exhibit 1.1 is followed by Exhibit 1.2, which has guidelines for determining significant differences in average reading achievement between the Exhibit 1.1 countries. Exhibit 1.3 includes all the countries presented according to average achievement, with the delayed assessment countries that assessed the fourth grade cohort at the beginning of the fifth grade highlighted in pink.

While PIRLS cannot determine cause and effects, in general there are downward trends in PIRLS 2021 that likely are evidence of the assessment taking place during the COVID-19 pandemic. Because the pandemic was unprecedented in the history of PIRLS trend assessments, the trends between 2016 and 2021 are shown with dotted lines. This should alert researchers that ***care should be taken when interpreting the PIRLS 2021 results***. Similar to the approach used for the PIRLS 2021 achievement data, the trend results for the countries that assessed fourth grade students are in one exhibit, with the “one year later countries” clearly annotated as having a 6-year trend instead of a 5-year trend between 2016 and 2021. Trend results for the countries with delayed assessments at the fifth grade ***need to be interpreted with great care*** due to the age difference and are shown in a separate exhibit.

Reporting the PIRLS 2021 Context Questionnaire Data

The PIRLS 2021 Context Questionnaire Framework (see Chapter 2 of [PIRLS 2021 Assessment Frameworks](#)) describes the topics covered by the PIRLS 2021 Context Questionnaires. PIRLS 2021 collected extensive data about the contexts for teaching and learning reading through questionnaires administered to students, their parents, teachers, and school principals.

The impact of COVID-19 on the PIRLS 2021 Context Questionnaire data is challenging to evaluate, but PIRLS 2021 did collect a considerable amount of valuable information on multiple levels. The school questionnaire results were only slightly impacted in the countries that delayed assessment to the fifth grade, because most schools had both fourth and fifth grades and the principals were asked to keep the fourth grade and the prior school year (2020–2021) in mind. The delayed assessments had the most impact on the teacher questionnaire data at the fifth grade. However, most countries tried to contact the teachers of the students from the fourth grade and asked teachers to keep the prior school year (2020–2021) in mind when responding to the questionnaire.

The TIMSS & PIRLS International Study Center conducted a series of analyses to establish that there was little or no difference in the responses to the Context Questionnaires between the bulk of the PIRLS 2021 countries that assessed students

at the end of fourth grade and the countries with delayed testing of the fourth grade cohort at the beginning of fifth grade.

PIRLS 2021 International Results in Reading includes results for all countries for selected items in the school, home, and student questionnaires (countries with delayed assessments of students in the fifth grade are highlighted in pink). Although COVID-19 impacted data collection, resulting in less questionnaire data included here than in previous assessment cycles, all of the PIRLS 2021 Context Questionnaire data are included in the [PIRLS 2021 International Database](#).

Quality Assurance

Despite the challenges that the COVID-19 pandemic introduced for schools and national research centers responsible for implementing PIRLS 2021, every effort was made to attend to the quality and comparability of the data through careful planning and documentation, cooperation among participating countries, standardized procedures, and rigorous attention to quality control throughout. The assessments were administered to nationally representative and well-documented probability samples of students in each country. Staff from Statistics Canada and IEA Hamburg worked with NRCs on all phases of sampling activities to ensure compliance with sampling and participation requirements, with a few exceptions from compliance annotated in the data exhibits.

IEA Amsterdam worked with the TIMSS & PIRLS International Study Center to manage an extensive series of verification checks to ensure the comparability of translations of the assessment items and questionnaires and to conduct the International Quality Assurance Program of school visits to monitor and report on the administration of the assessment. Together with the TIMSS & PIRLS International Study Center, IEA Hamburg staff worked closely with NRCs to organize data collection operations and to check all data for accuracy and consistency within and across countries.

The extensive efforts to maintain PIRLS' quality standards during the COVID-19 pandemic were largely successful. Complete documentation of the many technical activities required to conduct PIRLS 2021 is provided in the [Methods and Procedures: PIRLS 2021 Technical Report](#) documentation. The volume includes detailed information about the processes used to develop and implement the PIRLS 2021 assessments, including sampling, translation verification, data collection, scaling, linking, and data analysis.

SECTION 1

Countries' Reading Achievement

The PIRLS 2021 data about students' reading achievement provide an extremely valuable resource for continuing research about the impact of the COVID-19 pandemic on students' learning. PIRLS 2021 is the only large scale international assessment that successfully collected data during education's COVID-19 disruption. Further, the achievement data is accompanied by contextual information collected from several sources: principals' reports about school conditions, students' attitudes toward their reading instruction, and parents' perceptions regarding the impact of the pandemic on their children's learning (see later sections of the report on [Home Environment Support](#); [School Composition, Resources, and Climate](#); and [Students' Reading Attitudes and Behaviors](#)).

The About PIRLS 2021 Section

The first section, [About PIRLS 2021](#), provides a considerable amount of information about the PIRLS 2021 international assessment of reading comprehension at fourth grade (e.g., the content of the assessment, the 57 countries and 8 benchmarking entities participating in PIRLS 2021, the transition to digital assessment, and the numbers of students assessed).

Despite coinciding with school disruptions due to the COVID-19 pandemic, the PIRLS 2021 data collection successfully included nearly 400,000 students in 57 countries worldwide. Although the pandemic necessitated changes in school operations, frequently leading to school closures (see Exhibit 3 in [About PIRLS 2021](#)), the countries were able to make various adjustments in their data collection schedules, ranging from minor changes to essentially heroic efforts.

Exhibit 5 in [About PIRLS 2021](#) shows the chronology of the PIRLS 2021 data collection from October 2020 through July 2022. Fortunately, modifying the schedules had minimal impact on the quality of the PIRLS 2021 data. The thorough and well documented adjudications of the PIRLS 2021 sampling procedures and data collection outcomes found that the PIRLS guidelines to ensure high quality were met for the most part, while the few exceptions were annotated appropriately (see [Appendix A](#)). The International Quality Assurance Program also monitored and documented the data collection activities (see Chapter 6 in [Methods and Procedures: PIRLS 2021 Technical Report](#)).

Impacts of Modifying the Assessment Schedule on Students' Achievement

Consistently across assessment cycles, the PIRLS data collection procedures have included conducting the assessments at the end of the fourth grade school year so that as much of the curriculum has been covered as possible. In light of the data collection challenges in PIRLS 2021, 43 of the 57 countries managed to assess students at the end of the target school year, including conducting the assessment a year later than originally scheduled in a few countries (this is annotated in the exhibits with a bowtie after the countries' names). So far, no discernible achievement differences have been identified that are associated with assessing fourth grade students one year later than initially scheduled.

However, in the other 14 countries (all in the Northern Hemisphere), the necessary modifications to the data collection schedule delayed assessing students in the fourth grade cohort until the beginning of the fifth grade. In reviewing the PIRLS 2021 achievement results, it appeared that some of these countries had an achievement advantage in PIRLS 2021 that also was manifested in the relatively larger trend increases between 2016 and 2021 (see report section on [Trends in Reading Achievement](#)).

Of course, the reasons for any achievement differences are unknown. However, although there was variation, the average age of students in the 14 countries that delayed assessment until the beginning of the fifth grade was half a year older on average than the average age of students assessed at the end of fourth grade.

Average Ages of Students Assessed in PIRLS 2021 and PIRLS 2016 by Data Collection Period

PIRLS 2021 Data Collection Period	PIRLS 2021	PIRLS 2016	Difference
Assessed Fourth Grade Students at the End of the School Year	10.2	10.2	0.0
Delayed Assessment of Fourth Grade Cohort at the Beginning of Fifth Grade	10.8	10.2	0.5

Because of rounding, some results may appear inconsistent.

Beyond finding that these students were comparatively older, unfortunately, without any information about the reading achievement of the students in the 14 countries at the end of the fourth grade or their activities over the summer months, the PIRLS 2021 data in and of itself cannot be used to disentangle the extent of the impact of the delayed assessment on students' reading achievement. Researchers may be able to use within country data and local insights to study this issue in the future.

For now, however, throughout the report pink highlighting has been used to identify the results of the 14 countries where delayed assessment until the beginning of the fifth grade resulted in collecting data from a sample of comparatively older students.

Average Reading Achievement and Scale Score Distributions

The overall achievement results for the 57 PIRLS 2021 participating countries and 8 benchmarking participants are presented in three exhibits.

- Exhibit 1.1 shows the average reading achievement and scale score distributions for the 43 countries and 5 benchmarking participants that collected their data at the end of the fourth grade.
- For the countries in Exhibit 1.1, Exhibit 1.2 provides significance tests for differences between country averages. Results flagged as significant have a 1 in 20 error level. There is a 5 percent chance of declaring the sample differences significant, even though the true difference is zero.
- Exhibit 1.3 includes the average reading achievement and scale score distribution for all 57 countries and 8 benchmarking entities, including the results for the students in the 14 countries and 3 benchmarking entities (half a year older) that delayed data collection until the beginning of the fifth grade (highlighted in pink).

For the 43 countries and 5 benchmarking entities that assessed fourth grade students at the end of the school year, Exhibit 1.1 includes each country's average scale score with its 95 percent confidence interval as well as the range in performance for the middle half of the students (25th to 75th percentile—interquartile range) and the extremes (5th and 95th percentiles). The 43 countries are presented according to their average achievement in descending order. Please note that the countries annotated with a bowtie (⌘) assessed their fourth grade students at the end of the fourth grade school year, but one calendar year later than initially planned. The benchmarking participants are in a separate section at the bottom of the exhibit for ease of comparison.

Exhibit 1.1: Average Reading Achievement and Scale Score Distributions

Assessed Fourth Grade Students at the End of the School Year

☞ Assessed one year later than originally scheduled

The PIRLS achievement scale was established in 2001 based on the combined achievement distribution of all countries that participated in PIRLS 2001. To provide a point of reference for country comparisons, the scale centerpoint of 500 was located at the mean of the combined achievement distribution. The units of the scale were chosen so that 100 scale score points corresponded to the standard deviation of the distribution.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

See Appendix A.2 for population coverage notes 1, 2, and 3. See Appendix A.5 for sampling guidelines and sampling participation notes †, ‡, and ≡.

ψ Reservations about reliability because the percentage of students with achievement too low for estimation exceeds 15% but does not exceed 25%.

✕ Reservations about reliability because the percentage of students with achievement too low for estimation exceeds 25%.

Issues identified in Albania's data quality led to reduced comparability and framework coverage.

South Africa continued investigating its PIRLS 2021 results at the time of publication and will deal with the findings through its national report.

SOURCE: IEA's Progress in International Reading Literacy Study - PIRLS 2021

Downloaded from <https://pirls2021.org/results>

The results indicate that these 43 countries had relatively high achievement in reading at the fourth grade as a group. The fourth grade students in almost three-fourths (30 out of the 43 countries) had higher achievement than the scale centerpoint of 500 (a point that is stable across assessment cycles, see “History of the PIRLS Reading Achievement Scale”). As in previous cycles, the results also reveal that although the differences from country to country in average achievement were often small (considerable overlapping of confidence intervals), there was a substantial range in performance of nearly 300 scale score points from the top-performing to the lower-performing countries.

History of the PIRLS Reading Achievement Scale

The PIRLS reading achievement scale was established in PIRLS 2001, based on the achievement across all participating countries, treating each country equally. Students’ achievement is placed on the scale with the successive PIRLS cycles, most recently for PIRLS 2021. Reporting the achievement data from each successive PIRLS assessment on the PIRLS scale enables monitoring increases or decreases in achievement across assessment cycles. The scale has a typical range of achievement between 300 and 700. A centerpoint of 500 was set to correspond to the mean of overall achievement in 2001, with 100 points set to correspond to the standard deviation. PIRLS uses the scale centerpoint as a point of reference that remains constant from assessment to assessment.

The achievement distributions in Exhibit 1.1 show a large within-country range in many of PIRLS 2021 countries—about 200 points or even larger between lower- and higher-performing students. When considering average achievement, it is important to keep in mind the sizable variations within countries, and that every country has some very good readers as well as some struggling readers.

For the countries shown in Exhibit 1.1, Exhibit 1.2 provides significance tests for differences in average estimated reading achievement between one country and another country. Exhibit 1.2 is based on a traditional approach of testing for significance of differences and does not provide information about practical significance. Significance in the statistical sense means that the size of the difference is surprising compared to the standard error of the difference. In the exhibit, a 5 percent error rate was used to calculate whether a difference was flagged as significant or not. Differences should be triangulated with other data in order to come to meaningful interpretations of what the differences imply in terms of improving reading education in the countries (see Chapter 13 in [Methods and Procedures: PIRLS 2021 Technical Report](#)).

Exhibit 1.2: Significance of Differences Between Countries' Average Reading Achievement

Assessed Fourth Grade Students at the End of the School Year

☒ Assessed one year later than originally scheduled

Read across the row for a country to compare performance with the countries listed along the top of the chart. If no statistically significant difference was found, no symbol is present. If the difference is significant ($p < 0.05$), a symbol indicates whether the estimated achievement of the country in the row is higher (▲) than that of the comparison country, or lower (▼).

▲ Average achievement significantly higher than comparison country

▼ Average achievement significantly lower than comparison country

Significance tests were not adjusted for multiple comparisons. Five percent of the comparisons would be statistically significant by chance alone.
 () Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.
 Issues identified in Albania's data quality led to reduced comparability and framework coverage.

In Exhibit 1.2, reading across a country row provides a way to compare that country's average achievement to the average achievement of each of the other PIRLS 2021 countries shown across the top of the exhibit. Looking across the row for Singapore—the first country listed—shows an entire row of up arrows (▲), indicating that Singapore had higher average achievement (significant at $p < \alpha = 0.05$) than each one of the other countries.

Hong Kong SAR and the Russian Federation had the next highest average reading achievement. Although these two countries had lower average achievement (▼) than Singapore, each had higher estimated average achievement than the rest of the other countries in the exhibit. Going down the exhibit, looking across each row in turn, England (with its assessment conducted in 2022 as noted by the bowtie, ∞) had lower average achievement than Singapore, Hong Kong SAR, and the Russian Federation but higher achievement than the rest of the other countries. Next, Finland, Poland, Chinese Taipei, and Sweden had lower average reading achievement than the top four countries, but these four countries did not have different average achievement from each other and both Finland and Poland had higher estimated average reading achievement than each of the other countries.

Exhibit 1.3 presents average reading achievement and scale score distributions for all 57 countries and 8 benchmarking entities that participated in PIRLS 2021. Once again, the countries are presented in order of average achievement from highest to lowest. The countries with delayed testing and older students are highlighted in pink. Comparing back to Exhibits 1.1 and 1.2 that indicated Singapore through Sweden as the eight countries with relatively higher achievement than most of each of the other participating countries, it can be seen that these eight countries have been joined by five of the 14 countries with older students.

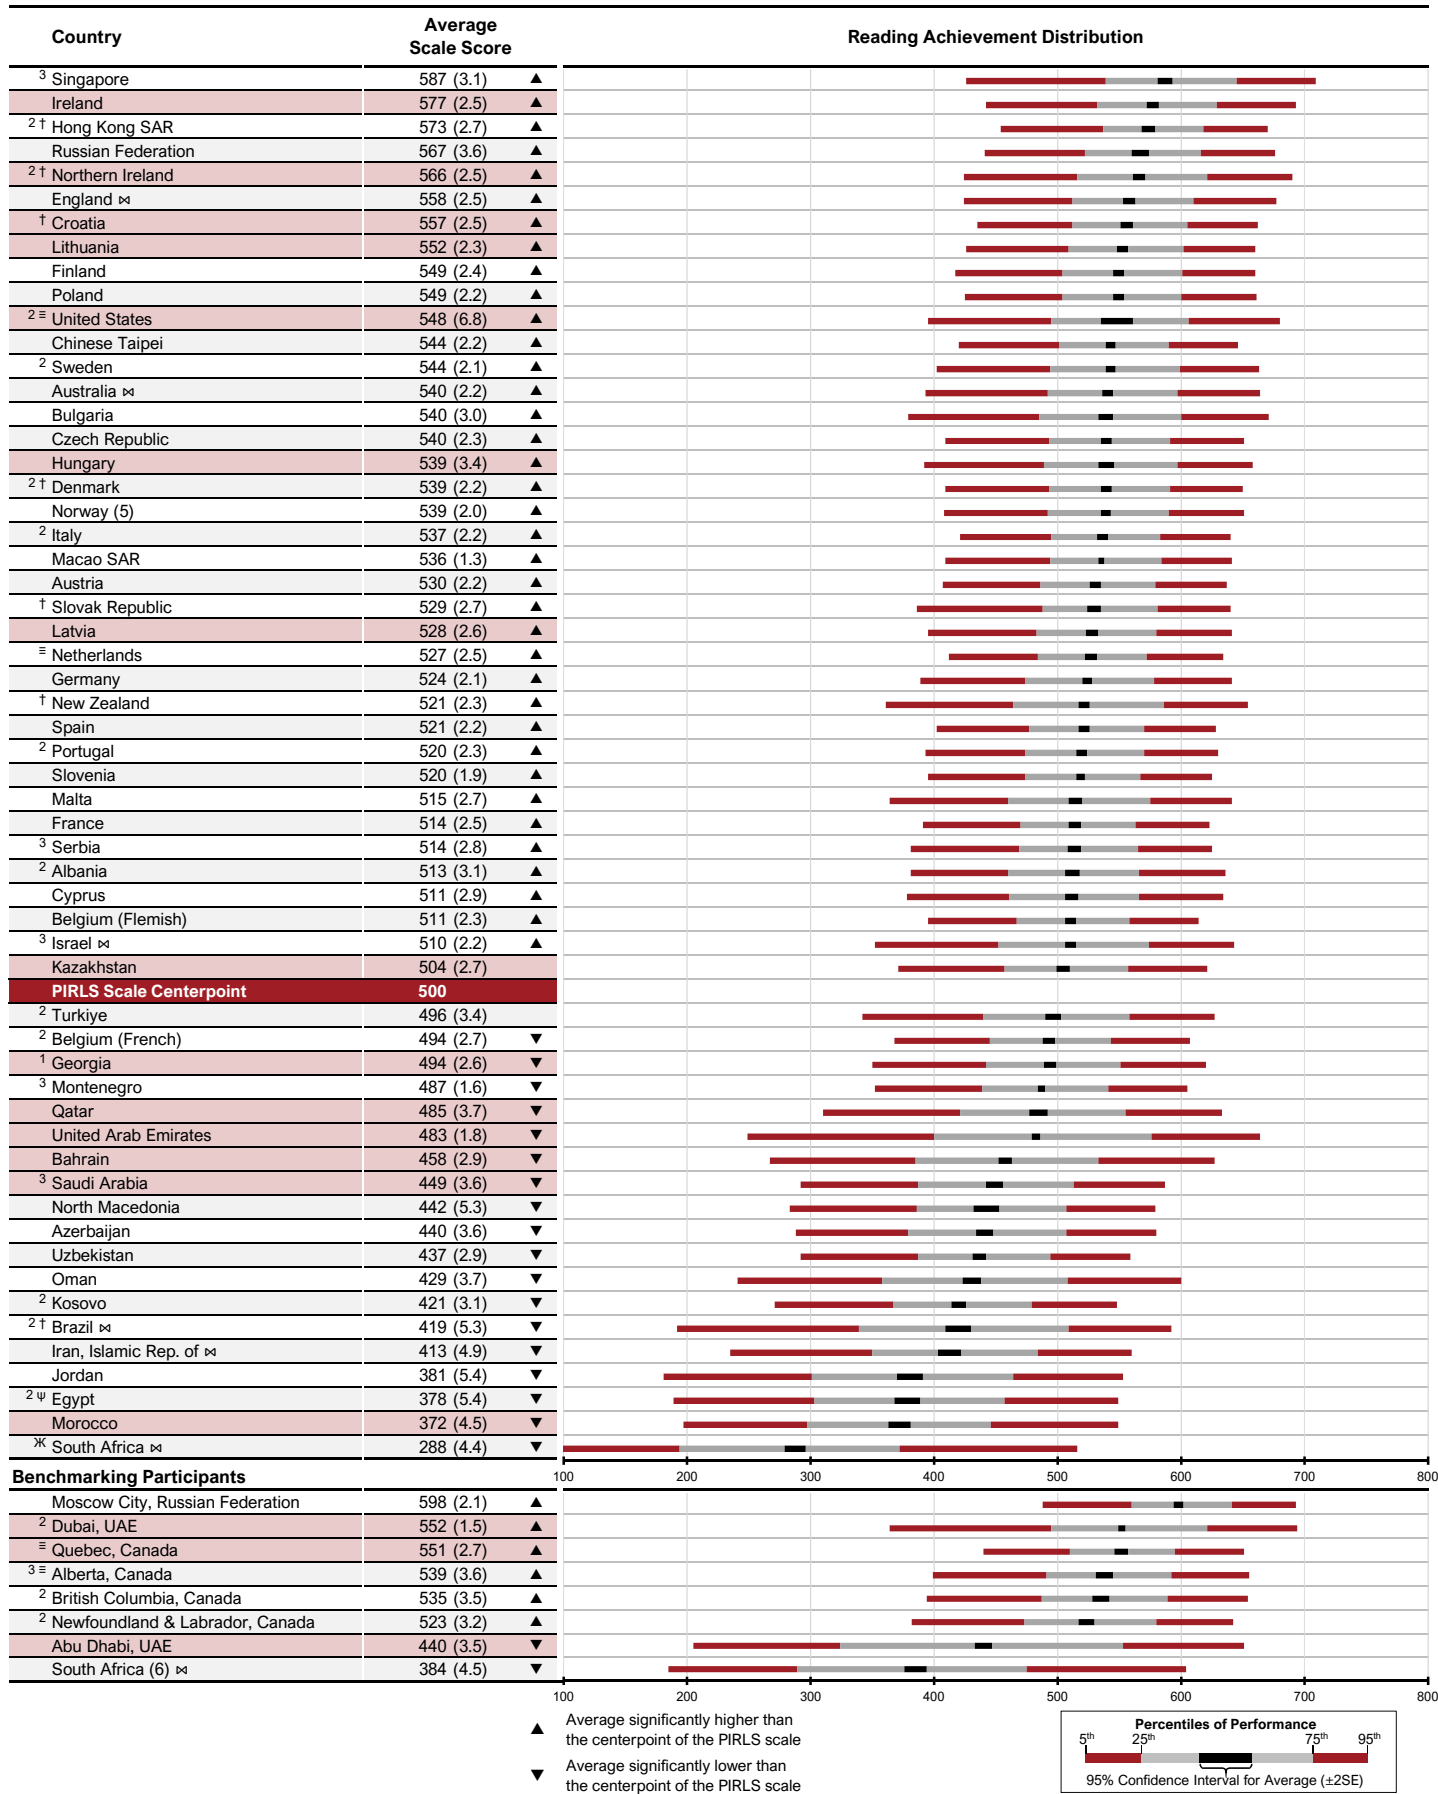

Despite not being able to identify the impact of the delayed assessment, it is clear that the students in these five countries are very capable readers. Could this perhaps be a sign of recovery from the impact of COVID-19 in these countries? Unfortunately, PIRLS has no way of isolating the effects that delaying the assessment of the fourth grade cohort over the summer until the beginning of fifth grade may have had on the reading achievement of these students, so ***direct comparisons with countries that assessed students at the end of fourth grade need to be made with great care.***

Exhibit 1.3: Average Reading Achievement and Scale Score Distributions

Assessed Fourth Grade Students at the End of the School Year

⌘ Assessed one year later than originally scheduled

■ Delayed Assessment of Fourth Grade Cohort at the Beginning of Fifth Grade

The PIRLS achievement scale was established in 2001 based on the combined achievement distribution of all countries that participated in PIRLS 2001. To provide a point of reference for country comparisons, the scale centerpoint of 500 was located at the mean of the combined achievement distribution. The units of the scale were chosen so that 100 scale score points corresponded to the standard deviation of the distribution.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

See Appendix A.2 for population coverage notes 1, 2, and 3. See Appendix A.5 for sampling guidelines and sampling participation notes †, ‡, and ≡.

ψ Reservations about reliability because the percentage of students with achievement too low for estimation exceeds 15% but does not exceed 25%.

✱ Reservations about reliability because the percentage of students with achievement too low for estimation exceeds 25%.

Issues identified in Albania's data quality led to reduced comparability and framework coverage.

South Africa continued investigating its PIRLS 2021 results at the time of publication and will deal with the findings through its national report.

Downloaded from <https://pirls2021.org/results>

Average Achievement by Gender

Exhibit 1.4 presents average reading achievement by gender in the 43 countries and 5 benchmarking entities where the fourth grade cohort was assessed at the end of the school year. Exhibit 1.5 presents the results for all 57 countries and 8 benchmarking entities, including the countries with delayed assessments at the fifth grade (highlighted in pink). In each exhibit, the countries are presented according to the size of the gender gap in average reading achievement from little or no difference between girls and boys to a rather large difference favoring girls.

The results show a pervasive advantage in reading achievement at the fourth grade for girls compared to boys, and this was no different for the countries with delayed testing at the fifth grade. Fourth grade girls had higher average achievement than boys in almost all the countries, with an average advantage of 16 points across the 43 countries (Exhibit 1.4) and 18 points across the 57 countries (Exhibit 1.5). According to Exhibit 1.5, there was no significant difference in achievement between boys and girls in Spain, the Czech Republic, Israel, Malta, and Iran.

SECTION 2

Trends in Reading Achievement

Measuring trends in achievement of student populations from one assessment cycle to the next is always an extremely complicated endeavor. PIRLS 2021 is the fifth assessment of PIRLS since its inception in 2001, providing 20 years of trend data. With each new assessment cycle, PIRLS has taken the utmost care to keep the majority of the assessment the same from cycle to cycle, to evolve carefully, and to document any differences. For PIRLS 2021, however, onset of the COVID-19 pandemic disrupted school operations often through school closures (see Exhibit 3 in [About PIRLS 2021](#)), which necessitated adjustments in the data collection schedules (see Exhibit 5 in [About PIRLS 2021](#)).

Data collected across the PIRLS 2021 countries to examine the impact of COVID-19 on students' learning and their reading achievement at the end of fourth grade is somewhat limited. The situation in each country and how the pandemic was handled was monitored and documented to the extent possible, while ensuring that the PIRLS assessment remained largely unchanged. Among these efforts, PIRLS 2021 reports from school principals are valuable and describe the extent of school closures. Exhibit 3 in [About PIRLS 2021](#) shows how closures varied from country to country as did the responses to school closures in terms of providing out-of-school learning opportunities. Parents' reports about the impact of the pandemic on their children's learning also varied across countries (Exhibit 4 in [About PIRLS 2021](#)), although parents reported that two-thirds of their children were negatively impacted in their learning to some degree.

Trends in Average Reading Achievement

Considering the PIRLS 2021 trend measures, it is well established that the COVID-19 pandemic, which happened after the 2016 cycle, made a major difference in school-based learning in many countries between 2016 and 2021. It also is well known that previous trend cycles were not affected by such a pandemic, so to represent this major difference for the most recent cycle in this report, the trends between 2016 and 2021 are shown with dotted lines. The dotted line is meant to call attention to the fact that the worldwide COVID-19 pandemic occurred after 2016, but the annotation does not indicate the size of the impact or even that there definitely was an impact in each country. The considerable variation in the extent and response to the pandemic

within and across countries makes it impossible to estimate the magnitude of a COVID-19 effect uniformly across countries or country by country at this time. It is more defensible to use ancillary national, regional, and local data to study the impact of the pandemic on student achievement within a country.

Analyzing trend results requires comparable cycle-to-cycle data of the estimates of average achievement that can be considered persistent rather than being the reflection of a particular circumstance. Country trend graphs are therefore generated only if there are comparable data points from at least one previous cycle and the current cycle. This leads to some attrition in the 57 countries and 8 benchmarking entities that participated in PIRLS 2021. As previously explained, 14 countries and 3 benchmarking entities delayed their PIRLS 2021 data collection so that they did not have comparable data in 2021. Next, 8 of the 43 countries that collected their PIRLS 2021 data at the end of the fourth grade school year had other reasons for not having comparable trend data from at least one previous cycle (e.g., 2021 was their first time participating in PIRLS, there was a major change in population definition, or they made numerous changes in translations of material reserved for trend).

For the 35 countries and three benchmarking entities that met the requirement for comparable trend data across two cycles or more, the results are presented in Exhibits 2.1.1 and 2.1.2. Exhibit 2.1.1 presents graphical representations of the differences in average reading achievement between PIRLS assessments. The data in Exhibit 2.1.2 provides the details documenting the changes in average achievement between specific assessments.

Exhibit 2.1.1: Trend Plots of Average Reading Achievement

Assessed Fourth Grade Students at the End of the School Year

Because the COVID-19 pandemic could have impacted recent trends between PIRLS 2021 and PIRLS 2016, those trends are discussed first. Of the 32 countries and 1 benchmarking participant with data in both 2016 and 2021, 21 countries (and the 1 benchmarking entity) had lower average reading achievement in 2021 than in 2016, 8 had no or little change, and only 3 had higher average achievement. That two-thirds of the PIRLS 2021 countries had a decline in average reading achievement between 2016 and 2021 suggests at least some widespread negative impact from the pandemic on reading achievement at the fourth grade. Also, looking only at the 21 countries with lower achievement in 2021 compared to 2016, 8 showed an improvement in 2016 compared to 2011 and 3 had no change. That is, in a number of countries an upward or stable trend from 2011 to 2016 changed to a downward trend in 2021.

The prevalence of downward trends in 2021 compared to 2016 also influenced the trends between 2021 and the previous cycles, complicating the picture of long-term trends. Singapore was the only country that showed steady improvement with each of the five PIRLS assessments. Slovenia posted improvements across the first four consecutive assessments until the recent decline in 2021. However, in general, the 15 countries that have comparable data across four or five assessments since 2001 have had their “ups and downs.”

Interestingly, despite the enormous challenge of maintaining educational improvement and the recent COVID-19 global pandemic, comparing just the 20-year trend results from start to finish between 2001 and 2021 for the 18 countries that participated in both assessments, there were 7 increases in average reading achievement, 6 with about the same achievement, and only 5 decreases in achievement. Also, considering this relative stability in achievement over the past 20 years and the enormous growth in the amount and variety of reading materials that today’s fourth grade students encounter in their daily lives due to the internet, perhaps there are some positive notes in the PIRLS 2021 long-term trends. This means that while countries see some changes in their achievement over time on a grand scale, at least for the set of 18 countries from which we have long term data, there is long term stability in achievement over time.

The trend results for the 14 countries that needed to delay the assessment of the fourth grade cohort until the beginning of the fifth grade are shown in Exhibit 2.2.1 (trend plots) and Exhibit 2.2.2 (differences in average achievement between the assessment cycles). The results show that 6 of the 13 countries with data from PIRLS 2016 had higher achievement in 2021 than in 2016. As explained previously (see earlier subsection: [Impacts of Modifying the Assessment Schedule on Students’ Achievement](#)), the high level of achievement for these countries in PIRLS 2021 may be partly due to the advantage of collecting data on somewhat older students (half a

year older on average). The delay in the assessment for these PIRLS 2021 countries may have increased the size of the gains in achievement to an unknown degree. However, age alone cannot be made responsible or separated out. Precise comparisons cannot be made back to PIRLS 2016, and it is noteworthy that a number of these countries also had high levels of reading achievement in 2016.

Exhibit 2.2.1: Trend Plots of Average Reading Achievement

■ Delayed Assessment of Fourth Grade Cohort at the Beginning of Fifth Grade

This exhibit displays changes in achievement for the countries and benchmarking participants that assessed the fourth grade cohort at the beginning of the fifth grade school year and have data from previous PIRLS assessments. Students in previous assessments were assessed at the end of the fourth year of schooling. Exhibit 2.2.2 provides details, including statistical significance. See Appendix A for country participation in previous assessments.

■ Prior to COVID-19 pandemic ■ During COVID-19 pandemic and at least 4 months older

See Appendix A for country participation in previous PIRLS assessments.

The scale interval is 10 points for each country, but a different part of the scale is shown according to each country's average achievement.

I. The black bars represent the 95% confidence interval.

Exhibit 2.2.2: Differences in Average Reading Achievement Across Assessment Years

Delayed Assessment of Fourth Grade Cohort at the Beginning of Fifth Grade

This exhibit reports differences in achievement across assessment years for the countries and benchmarking participants that assessed the fourth grade cohort at the beginning of the fifth grade school year and have data from previous PIRLS assessments. Read across the row to determine if the difference in performance between years is statistically significant. Symbols indicate if the row year is significantly higher (▲) or significantly lower (▼) than the performance in the column year. Students in previous assessments were assessed at the end of the fourth year of schooling. See Appendix A for country participation in previous PIRLS assessments.

Trends in Average Achievement by Gender

Exhibit 2.3 contains the trend results by gender for the 43 countries that assessed fourth grade students at the same time of year as in previous assessments. Although 21 countries had lower average achievement in 2021 than in 2016, for the most part the decreases in achievement were similar for girls and boys such that there was little narrowing (or widening) in the gender gap favoring girls. The Czech Republic, Iran, Israel, and Spain narrowed their gender gaps, while Macao SAR and Portugal showed a small gap in 2021.

Exhibit 2.3: Trend Plots of Average Reading Achievement by Gender

Assessed Fourth Grade Students at the End of the School Year

Assessed one year later than originally scheduled – six year trend from PIRLS 2016

This exhibit displays changes in achievement for girls and boys in each country and benchmarking participant that assessed fourth grade students at the end of the school year and have comparable data from previous assessments. See Appendix A for country participation in previous assessments.

* Average significantly higher than other gender

See Appendix A for country participation in previous PIRLS assessments.

The scale interval is 10 points for each country, but a different part of the scale is shown according to each country's average achievement.

Exhibit 2.4 contains the trend results by gender for the 14 countries with delayed assessment of the fourth grade cohort at the beginning of the fifth grade. Although nearly half these countries (6 out of 13, see Exhibit 2.2.1) had increased average achievement overall between 2016 and 2021, the gender gaps favoring girls remained relatively stable. Considering the results in both Exhibits 2.3 and 2.4, it seems that little progress has been made in closing the reading achievement gender gap favoring girls.

Exhibit 2.4: Trend Plots of Average Reading Achievement by Gender

SECTION 3

Relative Achievement in Reading Purposes and Comprehension Processes

Published as Chapter 1 in the *PIRLS 2021 Assessment Frameworks*, the PIRLS 2021 Reading Assessment Framework provided the guidelines for developing the assessment content. Since the inception of PIRLS in 2001, the assessment framework has been organized according to two overarching purposes for reading:

- For literary experience
- To acquire and use information

As shown below, the framework also describes four cross-cutting reading comprehension processes: retrieving, straightforward inferencing, interpreting and integrating, and evaluating and critiquing. The illustration includes the targeted weights of coverage, showing that PIRLS should involve 50 percent literary texts and 50 percent informational texts as well as 20 percent, 30 percent, 30 percent, and 20 percent of the four cross-cutting reading comprehension processes.

From country to country, as a result of the curriculum or other factors, students might have relative strengths and weaknesses in reading literary compared to informational texts. The next part of this section of the report shows countries' relative achievement in reading literary texts compared to reading informational texts in PIRLS 2021. The second part of this section presents the relative achievement results for two broad comprehension processes— 1) retrieving and straightforward inferencing and 2) interpreting, integrating, and evaluating.

For information about how the subscales for the reading purposes and comprehension processes were created, see Chapter 11 in [Methods and Procedures: PIRLS 2021 Technical Report](#). The results in the purpose and process subscales are presented to provide a more nuanced view of overall reading achievement. The comparison between overall reading achievement and particular subscales may indicate countries' relative strengths and weaknesses within overall reading. However, the subscales are based on only half the assessment items, making them somewhat less robust than the overall reading achievement results based on the entire scale. The subscale trend results are not reported here because they are less stable than the overall trend results and could be even further influenced by COVID-19 to an unknown degree.

Relative Achievement in Reading Purposes

Young students read for a wide variety of reasons and encounter a wide variety of texts with different content and in different formats. However, whether their reasons for reading are for interest, entertainment, or learning, much of the reading done by young students both in and out of school can be broadly described as either reading stories (with a plot and characters often in a narrative structure) or reading materials that provide information. As young students develop their literacy skills and are increasingly required to read to learn across the curriculum, reading to acquire information could become more frequent.

The [International Benchmarks](#) section of the report includes a description of the texts used to assess the literary and informational purposes, as well as videos of example texts and items.

Exhibits 3.1 and 3.2 show relative average achievement in literary and informational purposes in comparison to average achievement overall. Starting at the top of the exhibits, the results are organized according to the extent that countries had relatively higher achievement in the informational purpose (and lower in literary) compared to their overall achievement, followed by countries with little difference in achievement between the two purposes in the middle of the exhibit, and countries with relatively higher achievement in the literary purpose (and lower in informational) compared to their overall achievement at the bottom.

▲ Purpose score significantly higher than overall PIRLS score
▼ Purpose score significantly lower than overall PIRLS score

■ Literary Reading
■ Informational Reading

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

See Appendix A.2 for population coverage notes 1, 2, and 3. See Appendix A.5 for sampling guidelines and sampling participation notes †, ‡, and ≡.

ψ Reservations about reliability because the percentage of students with achievement too low for estimation exceeds 15% but does not exceed 25%.

✳ Reservations about reliability because the percentage of students with achievement too low for estimation exceeds 25%.

Issues identified in Albania's data quality led to reduced comparability and framework coverage.

Exhibit 3.1 shows only the results for the 43 countries and 5 benchmarking participants that assessed PIRLS 2021 at the end of the fourth grade school year. However, this discussion about relative strengths and weaknesses in reading literary texts compared to strengths in weaknesses in reading informational texts will be based on Exhibit 3.2 which presents the results for all 57 countries and 8 benchmarking entities that participated in PIRLS 2021, including the 14 countries and 3 benchmarking entities that needed to delay data collection until the beginning of the fifth grade and have comparably older students (half a year older on average, highlighted in pink).

Looking at the top of the exhibit under the informational column, the data show that 9 countries had higher relative achievement (at least 2 score points) based on the informational materials than on the PIRLS 2021 assessment as a whole. Although three East Asian countries, Macao SAR, Hong Kong SAR, and Chinese Taipei had differences from overall reading ranging from 6 to 12 scale score points, most of the differences were rather small (1 to 4 points).

The lower portion of the exhibit shows that 18 countries had a relative strength in the literary purpose, nearly double the number with a relative strength in the informational purpose. Also, by means of the differences being defined relative to the overall, a relative strength in the literary purpose will often be accompanied by a relative weakness in the informational purpose. Twenty-three of the 57 countries in Exhibit 3.2 had both a relative strength in one purpose and a relative weakness in the other, while 11 countries had only a relative strength or a weakness in one purpose.

Many countries (23) did not display a relative strength or weakness in reading achievement for either purpose. However, the prevalence of relative strength in the literary purpose is consistent with a reading curriculum that begins with stories in the early grades and then transitions to reading about science, history, and geography as students move to the upper grades.

Relative Achievement in Comprehension Processes

Exhibits 3.3 and 3.4 present relative achievement for two reading comprehension processes: 1) retrieving and straightforward inferencing and 2) interpreting, integrating, and evaluating. More specifically:

- **Retrieving and Straightforward Inferencing** (often related to a small portion of the text) is based on combining the items categorized as “focus on and retrieve explicitly stated information” and “make straightforward inferences” (50% of the items)

- **Interpreting, Integrating, and Evaluating** (often related to larger portions or the entire text) is based on combining the items categorized as “interpret and integrate ideas and information” and “evaluate and critique content and textual elements” (50% of the items)

Exhibits 3.3 and 3.4 show relative average achievement in the more straightforward processes and in the more integrative comprehension processes compared to average reading achievement overall. The results are organized according to the extent that countries had relatively higher achievement in the interpreting/integrating/evaluating comprehension processes than their average achievement overall (top of the exhibit) and to the extent that countries had relatively higher achievement in the retrieving/inferencing processes than in their overall achievement (bottom of the exhibit). Countries in the middle of the exhibit had little difference in average achievement between the more integrative and the more straightforward comprehension processes, with average achievement in both subdomains being very similar to average reading achievement overall.

Exhibit 3.3 presents the results for the 43 countries and 5 benchmarking entities that assessed their students at the end of the fourth grade school year. However, this discussion will be based on Exhibit 3.4 with the results for all 57 countries and 8 benchmarking entities that participated in PIRLS 2021, including the 14 countries and 3 benchmarking entities that delayed assessment until the fall of the fifth grade (shown in pink).

Looking at the top of the graph in Exhibit 3.4, the data show 15 countries with a relative strength in the interpreting/integrating/evaluating comprehension processes (3 to 8 scale score points) compared to their reading achievement overall. A few more countries (18) had a relative weakness in the retrieving/inferencing comprehension processes. These relative differences provide an interesting source for country-level analyses conducted by experts of their respective education systems. Such analyses could focus on curricular differences that may provide information about how these strengths and weaknesses can be explained.

The lower portion of the exhibit shows that 10 countries had a relative strength in the retrieving/straightforward inferencing processes compared to their overall achievement, with 16 having a relative weakness (at least 2 scale score points) in the interpreting/integrating/evaluating comprehension processes.

SECTION 4

Performance at International Benchmarks

To implement meaningful policy and curriculum reform, it is important to understand the differences in students' reading competencies associated with higher or lower scores on the PIRLS reading achievement scale. For example, in terms of students' reading comprehension skills and strategies, what does it mean for a country to have an average achievement of 513 or 426? Looking at additional data analyses can help a country determine if its students have gained the reading comprehension skills covered in the reading curriculum.

To provide an interpretation of the PIRLS 2021 average results summarized on the PIRLS achievement scale for reading comprehension in the fourth grade, this section of the report describes achievement at four points along the scale as International Benchmarks: Advanced International Benchmark (625), High International Benchmark (550), Intermediate International Benchmark (475), and Low International Benchmark (400). To develop the descriptions of the reading comprehension skills and strategies demonstrated by fourth grade students reaching each International Benchmark, the TIMSS & PIRLS International Study Center conducted a scale anchoring exercise together with the PIRLS 2021 Reading Development Group (RDG). With the PIRLS 2021 transition to a digital assessment, the scale anchoring was based on digital data. Further detail about the scale anchoring methodology is provided in Chapter 14 of [Methods and Procedures: PIRLS 2021 Technical Report](#).

Descriptions of the PIRLS 2021 Texts

To reflect the PIRLS 2021 Reading Assessment Framework (Chapter 1 in [PIRLS 2021 Assessment Frameworks](#)), the International Benchmark descriptions were developed separately for the two overall reading purposes—Literary and Informational. The texts for the two purposes are described below because the benchmark descriptions consider the difficulty of the texts the students are asked to read in PIRLS. Students use somewhat similar reading comprehension skills and strategies with each higher benchmark, but the complexity and difficulty of the texts increases. Average text difficulty has been estimated by the average percent correct across items based on digital data.

Literary Texts

The PIRLS 2021 literary assessment included nine texts presented in the PIRLS 2021 digital format. The texts were complete short stories or episodes accompanied by supportive illustrations. The texts included contemporary and traditional stories with one or two main characters, a plot with one or two central events, and an overall theme or message. Taken as a whole, the literary texts included a range of styles designed to encourage students to engage with the events, settings, actions, consequences, characters, atmosphere, feelings, and ideas in the stories.

In accordance with the group adaptive assessment design, the texts represented three levels of difficulty—easy, medium, and difficult. The easy texts (76% correct on associated items, on average) were relatively accessible, approximately 500 words in length, with a clear linear structure, explicit meanings, and simply described characters. The language featured everyday vocabulary and straightforward sentence structures. The difficult texts (56% correct on associated items, on average) were relatively complex, approximately 850 words in length, with scope for exploring layers of meaning, such as plot twists, development of complicated ambivalent characters, and abstract ideas. They included a range of vocabulary, imagery, and figurative language. The medium texts (66% correct on associated items, on average) were of intermediate complexity, approximately 700 words in length, with a narrative structure and a clear message.

Informational Texts

The PIRLS 2021 assessment of informational reading included nine texts presented in the PIRLS 2021 digital format. The informational texts included a variety of continuous as well as non-continuous texts with charts and graphs. The texts had presentational features such as diagrams, maps, illustrations, photographs, or tables. The range of material covered scientific, biographical, and historical information and ideas. Texts were structured in a number of ways, including by logic, argument, chronology, and topic. Several included organizational features such as subheadings or text boxes.

In accordance with the group adaptive assessment design, the nine texts represented three levels of difficulty—easy, medium, and difficult. The easy texts (74% correct on associated items, on average) were approximately 500 words in length with a clear structure, explicit meanings, and straightforward sentence structures. The difficult texts (51% correct on associated items, on average) were approximately 850 words in length and conceptually more demanding, based on abstract or technical ideas and with a substantial number of embedded details, some complex sentences, and topic-specific vocabulary. The medium texts (60% correct

on associated items, on average) were of intermediate complexity, approximately 700 words in length.

The PIRLS 2021 assessment also included five tasks specifically designed to assess online informational reading based on simulated websites about scientific and historical subject matter. Each task was structured as a class project or report, with an avatar teacher who introduced the questions and guided the students through the task. Each task involved students working across approximately three different websites with an average of 1,000 words of text per task and as many as 10 web pages. In addition to the text, the tasks included different kinds of visual information, such as photos, charts, and maps, as well as many navigational and dynamic features, such as animations, hyperlinks, tabs, and pop-up boxes. The five tasks were either difficult or medium (60% correct on associated items, on average).

Examples of the PIRLS 2021 Texts and Items

Video examples of one Literary text, *The Empty Pot*, and two Informational texts, *The Amazing Octopus* and *Oceans* (ePIRLS task), can be viewed below. The videos show each text in its entirety, together with its associated items.

Video Examples of the PIRLS 2021 Texts

THE EMPTY POT

Digital PIRLS Literary

THE AMAZING OCTOPUS

Digital PIRLS Informational

OCEANS

ePIRLS Online Informational

- *The Empty Pot* is a literary story with a message. The Emperor passes out seeds for a contest to see who will be the next Emperor. Jun is ridiculed when his seed does not grow and is ashamed to face the Emperor. However, Jun's empty pot indicates his honesty because the seeds were boiled.
- *The Amazing Octopus* is an informational article about the characteristics of octopuses and some behaviors they display when they are in aquariums. Newly developed in PIRLS 2021, it has some animation to indicate the direction possible in future assessments.

- *Oceans* is an ePIRLS task consisting of three simulated websites about 1) the benefits of oceans, 2) ocean habitats, and 3) the problem of plastic pollution. Across the colorful web pages, there are a variety of navigational features, pop-ups, links, a video, and advertisements.

Descriptions of Reading Achievement at the PIRLS 2021 International Benchmarks

The PIRLS 2021 International Benchmarks build on each other, representing increasingly demanding reading comprehension skills and strategies with each higher benchmark—Low, Intermediate, High, and Advanced. The students who reached a benchmark also reached all previous benchmark(s). For example, students who reached the Advanced Benchmark also reached the Low, Intermediate, and High Benchmarks. Consistent with the two reading purposes that provide the foundation of the [PIRLS 2021 Reading Assessment Framework](#), the scale anchoring analysis was conducted separately for the literary and informational texts and items. Within each reading purpose, the progression in reading comprehension processes can be seen from the description of the different benchmarks.

● Advanced International Benchmark (625)

Literary

When reading predominately difficult literary texts, students can:

- Interpret and integrate story events and character actions to describe reasons, motivations, feelings, and character development
- Evaluate the intended effect of the author’s language, style, and composition choices

Informational

When reading predominately difficult informational texts or online tasks, students can:

- Make inferences about complex information across different web pages and parts of text to recognize the relevant information in a list and use evidence in the text to support ideas
- Interpret and integrate multiple pieces of different information across text and web pages to present an overview of ideas in the text and provide comparisons and explanations
- Evaluate textual, visual, and interactive elements to explain their purpose, and identify the writer’s point of view and provide supporting evidence

○ High International Benchmark (550)

Literary

When reading medium and difficult literary texts, students can:

- Locate and identify significant actions and details embedded across the text
- Make inferences about relationships between intentions, actions, events, and feelings
- Interpret and integrate story events to give reasons for character actions and feelings
- Recognize the meaning of some figurative language (e.g., metaphor, imagery)

Informational

When reading informational texts or online tasks of medium or high difficulty, students can:

- Locate and identify relevant information in texts with a variety of features, such as diagrams and illustrations
- Make inferences to provide comparisons, descriptions, explanations, predictions, and choose a relevant website
- Interpret and integrate textual and visual information across texts and web pages to connect ideas, sequence events, identify characteristics, and provide explanations
- Evaluate the content to take and justify a position; describe how illustrations, diagrams, photographs, and maps convey and support content; and recognize the contribution of word choice in conveying the writer's point of view

● Intermediate International Benchmark (475)

Literary

When reading literary texts of easy or medium difficulty, students can:

- Locate, recognize, and reproduce explicitly stated actions, events, and feelings
- Make straightforward inferences about events and characters' actions
- Interpret reasons for characters' feelings or actions and identify supporting evidence

Informational

When reading informational texts or online tasks of easy or medium difficulty, students can:

- Locate, recognize, and reproduce explicitly stated information across texts
- Make straightforward inferences to provide comparisons, descriptions, and explanations
- Interpret and integrate to provide information about central ideas and reasons for actions, events, and outcomes

○ Low International Benchmark (400)

Literary

When reading predominantly easy literary texts, students can:

- Locate, retrieve, and reproduce explicitly stated information, actions, or ideas
- Make simple, straightforward inferences about characters' actions

Informational

When reading predominantly easy informational texts, students can:

- Locate, retrieve, and reproduce explicitly stated information
- Make simple, straightforward inferences to provide a reason for an outcome

Percentages of Students Reaching the International Benchmarks

This section presents the PIRLS 2021 reading achievement results through the lens of the reading comprehension skills and strategies demonstrated by the students reaching each of the four International Benchmarks. The descriptions of students' reading competencies at the four benchmarks, together with the percentages of students reaching the successive benchmarks, provide a profile of reading achievement in each country.

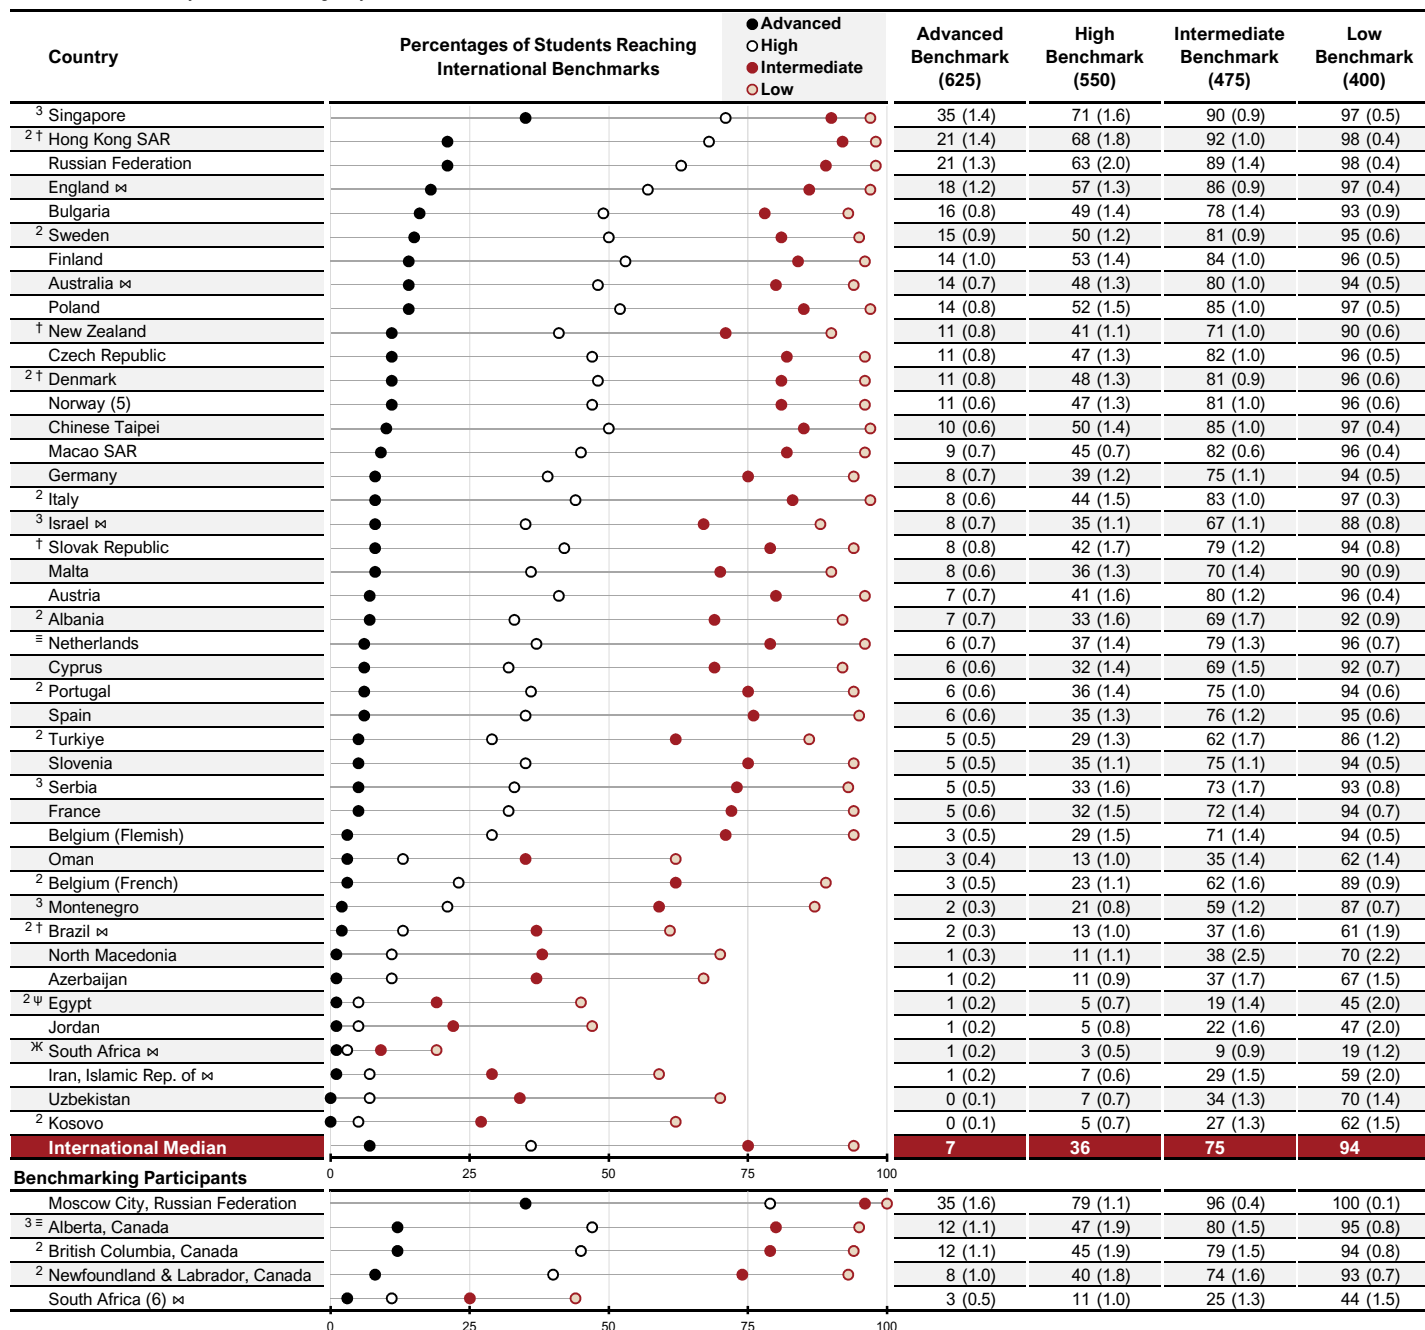

Exhibit 4.1 presents the percentages of students reaching each of the PIRLS 2021 International Benchmarks of Reading Achievement for the 43 countries and 5 benchmarking entities that assessed their fourth grade students at the end of the school year. The countries are presented in descending order according to the percentage of students reaching the Advanced International Benchmark, with the results shown graphically and the percentage reaching each benchmark provided.

The Advanced International Benchmark is a very high target and, as has been shown in previous PIRLS assessments, only small percentages of students reach the advanced level. Remarkably, Singapore had more than one-third (35%) of its fourth grade students reaching the advanced level. Then, after a gap, Hong Kong SAR and the Russian Federation each had 21 percent followed by England (18%), Bulgaria (16%), and Sweden (15%). The median percent reaching the Advanced International Benchmark was 7, so of the countries that assessed students at the end of the fourth grade year, half had 7 percent or fewer students reaching the advanced level.

Downloaded from <https://pirls2021.org/results>

The fourth grade students reaching the High International Benchmark are relatively competent readers, able to interpret, integrate, and evaluate a variety of text and visual elements in medium and difficult reading materials. The median cumulative percentage (including the percentage reaching the Advanced Benchmark) of students reaching the High Benchmark was 36 percent. However, the range was very large, from a high of 71 percent to a low of 5 percent. In 10 countries, fewer than 20 percent of the fourth grade students reached the High International Benchmark. Similarly, although at least three-fourths of the fourth grade students reached the Intermediate International Benchmark in half the countries (cumulative median percentage of 75), the results ranged from 92 to 9 percent.

On a very positive note, the median percentage of fourth grade students reaching the Low International Benchmark was 94 percent indicating close to universal basic literacy at the fourth grade in the majority of the PIRLS 2021 countries. In all but 10 of the countries, at least 85 percent of the fourth grade students reached the Low International Benchmark.

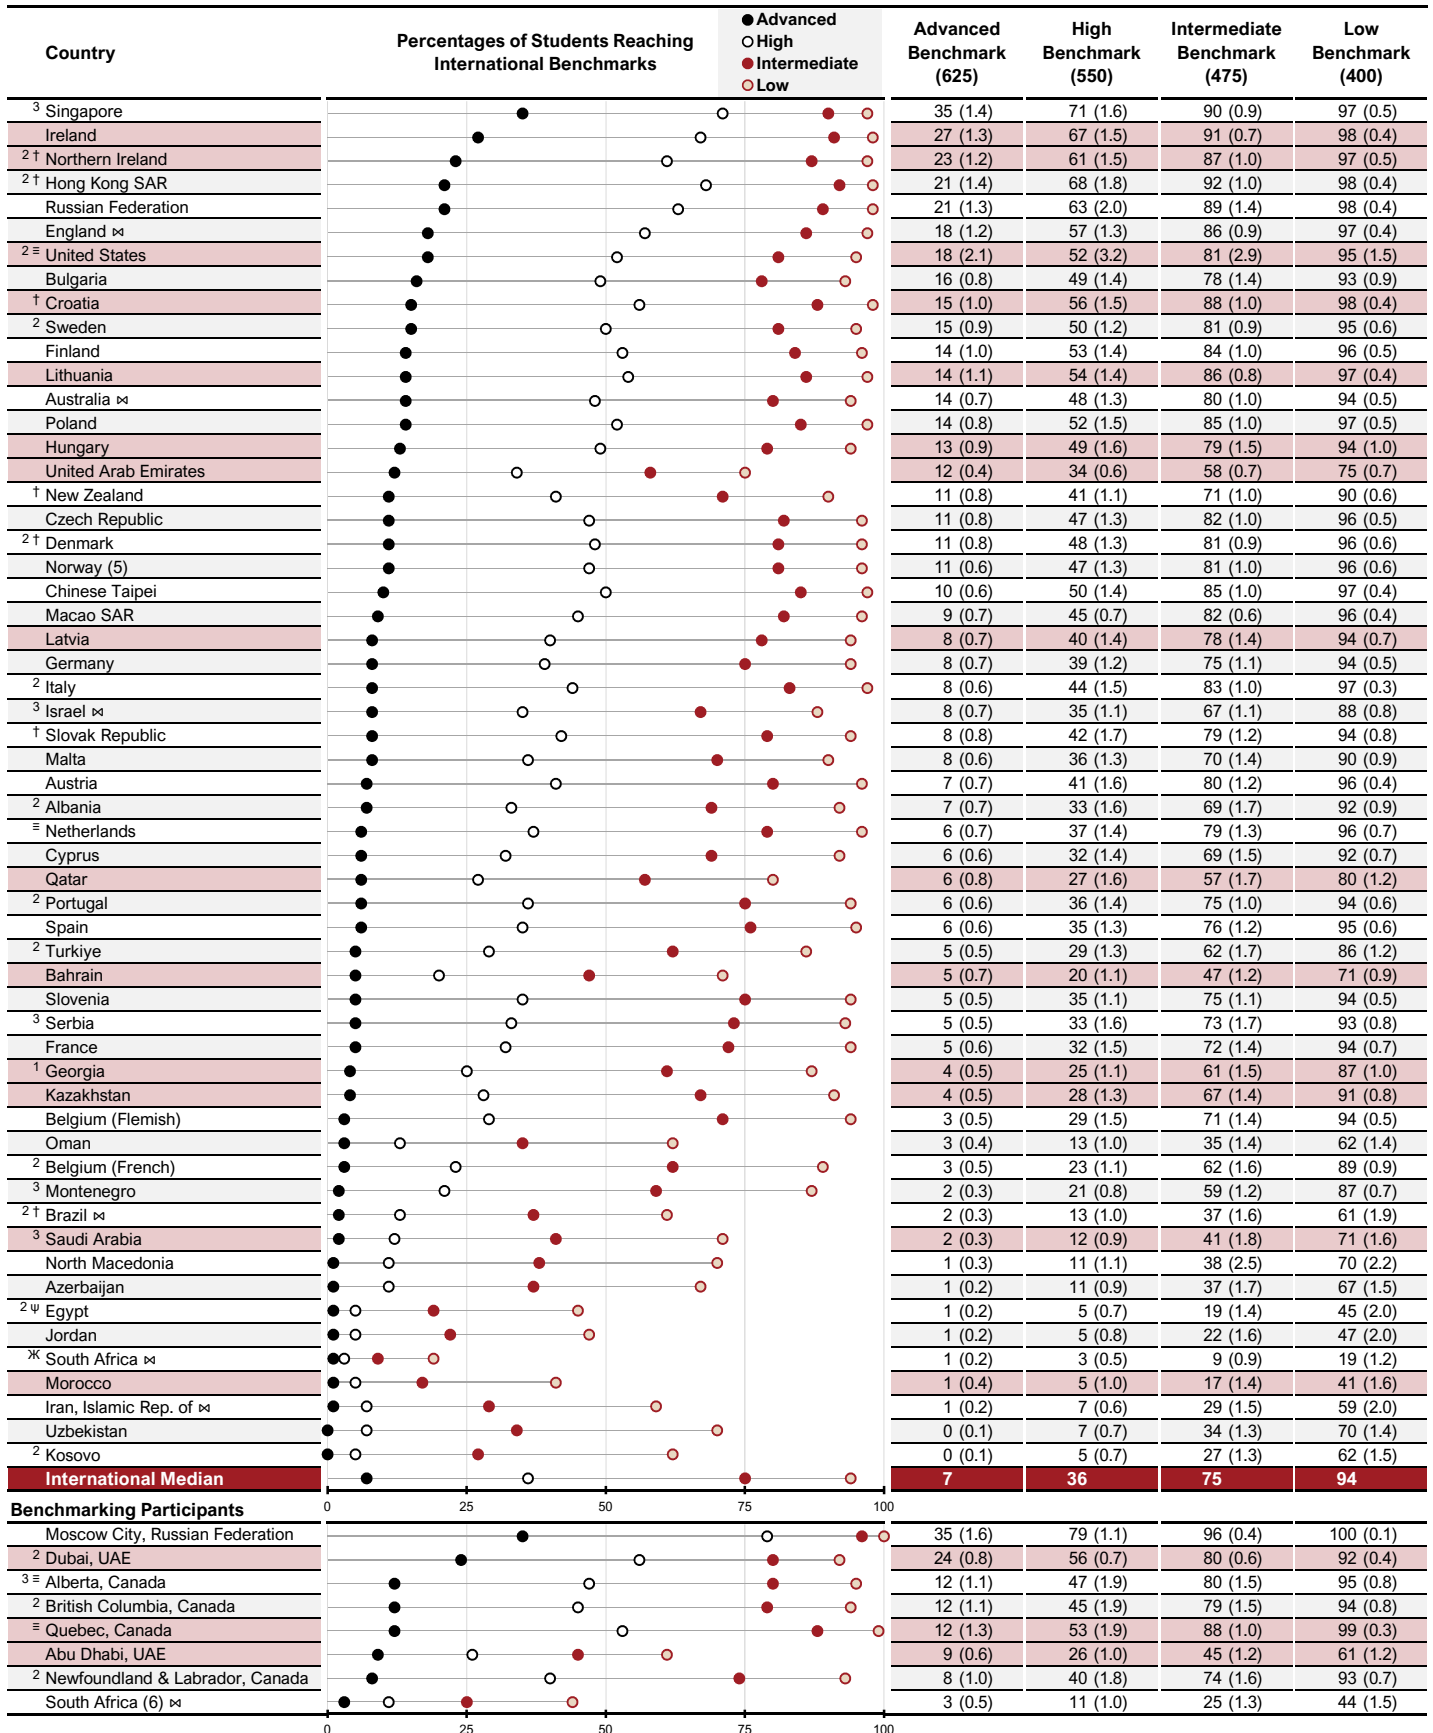

Exhibit 4.2 shows the percentages of students reaching the PIRLS 2021 International Benchmarks for all 57 countries and 8 benchmarking entities, including the 14 Northern Hemisphere countries that necessarily delayed assessing the fourth grade cohort of students until after the summer at the beginning of fifth grade (shown in pink). As described earlier, the students in these 14 countries were 6 months older on average than the students in the other countries, which may have contributed to higher average achievement (see previous subsection: [Impacts of Modifying the Assessment Schedule on Students' Achievement](#)). Exhibit 4.2 shows that, in addition to the 6 countries in Exhibit 4.1 that had 15 percent or more of their students reaching the Advanced International Benchmark, 4 of these 14 countries also had 15 percent or more of their students reaching the advanced level—Ireland (27%), Northern Ireland (23%), United States (18%), and Croatia (15%). Looking at the Low International Benchmark, 9 of the 14 countries had at least 85 percent of their students reaching this level of basic literacy.

Trends in the Distributions of Achievement at the International Benchmarks

From PIRLS assessment cycle to assessment cycle, many countries work to improve levels of reading achievement such that increasingly higher percentages of fourth grade students reach successively higher International Benchmarks on the PIRLS achievement scale. Of course, the amount of progress and at which benchmarks this is feasible depends on the contexts for teaching and learning within each country. For example, a literacy initiative targeted to improve reading achievement for lower-performing students may be reflected in increased percentages of students reaching the Low and Intermediate Benchmarks with little change at higher benchmarks. Raising the level of reading achievement for all students across the achievement distribution is challenging and has not occurred in many PIRLS countries.

Exhibit 4.3 provides bar graphs of the trend results across the benchmarks for the 35 countries and 3 benchmarking entities that assessed students at the end of the school year and have data from previous cycles, with the countries that assessed students a year later than originally planned annotated with a bowtie (⌘) after their names. The bar graphs for each country present the distribution of achievement at the PIRLS International Benchmarks with a bar for each cycle from 2001 to 2021. The bar for 2021 has dashed lines to indicate that the 2021 results are based on data collected during the time of COVID-19 and may or may not be impacted by the pandemic. The bar graphs of the trend results are presented in alphabetical order country by country.

Downloaded from <https://pirls2021.org/results>

Example of Singapore

Singapore’s results provide a good example as a basis for discussion of how to read the graphs because this country has participated in all five cycles of PIRLS, had relatively high achievement in PIRLS 2001, and has increased the percentages of students reaching the higher PIRLS International Benchmarks with each successive assessment cycle.

Example of Singapore from Exhibit 4.3: Trends in the Distribution of Students Reaching the PIRLS International Benchmarks

Looking at the bars in Singapore’s graph, it can be seen that Singapore has results for all five PIRLS assessments. Each bar in the graph shows the cumulative percentage of students reaching the benchmarks in that assessment cycle. The more of the bar that is shaded (no matter how dark), the larger the percentage of students that reached the Low International Benchmark.

Looking at the bottom of Singapore’s first bar for 2001, reading down the 0 to 100 scale on the left of the graph shows that about 90 percent of the Singaporean fourth grade students reached the Low International Benchmark in the first assessment. Further, by subtraction from 100, the difference between the bottom of the bar and 100 indicates the percentage of students that did not reach the Low International Benchmark. Looking at Singapore’s 2001 bar, it can be determined that 10 percent of the students did not reach the Low International Benchmark (were “below low”) in the first PIRLS assessment.

Moving up Singapore’s 2001 bar, 76 percent of the students reached the Intermediate Benchmark. Next, 45 percent of the students reached the High International Benchmark, and 12 percent of the students reached the Advanced International Benchmark. With each higher benchmark, the shading on the bar

becomes darker. Larger amounts of darker shading on a bar indicate higher percentages of students reaching the High and Advanced International Benchmarks. For the Intermediate, High, and Advanced International Benchmarks, it should be remembered that the students reaching those benchmarks demonstrated all the reading skills displayed by the students at the lower levels.

Moving to the right across the bars in Singapore's graph across the assessment cycles, between the first two 2001 and 2006 bars, Singapore increased the percentage of students reaching each of the four International Benchmarks in PIRLS 2006 to the extent that nearly all students (97%) reached the Low International Benchmark and 86 percent reached the Intermediate International Benchmark. Also, moving across the bars for 2001 through 2021 shows steady progress in increasing the percentages of more proficient readers with each subsequent assessment cycle. That is, a successively higher percentage of students reached the High International Benchmark with each assessment and a successively higher percentage of students reached the Advanced International Benchmark.

Although Singapore was the only country to achieve such positive trend results across the International Benchmarks, several other countries have made good progress. For example, Hong Kong SAR has a similar pattern, although with smaller changes from cycle to cycle. Also, several countries were making progress across their benchmark distributions until there were declines between PIRLS 2016 and 2021, including Chinese Taipei, the Russian Federation, the Slovak Republic, and Slovenia. The decreases between 2016 and 2021 are consistent with the apparent impact of COVID-19 observed in the PIRLS trends more generally (see Exhibits 2.1.1 and 2.1.2 in [Trends in Reading Achievement](#)). However, as explained in previous sections, no control groups in 2021 are available that can tell us what the distribution would have been without the pandemic.

For most of the countries that have participated in four or five PIRLS assessment cycles, the trend results in the benchmark distributions show relative stability in the percentages of students reaching each benchmark or minor fluctuations at one or two benchmarks.

Exhibit 4.4 shows trends across the benchmarks for the 14 Northern Hemisphere countries that necessarily delayed assessing the fourth grade cohort of students until after the summer at the beginning of fifth grade. As described earlier, the students in these 14 countries were half a year older on average than the students in the other countries, which may have contributed to higher average achievement (see previous subsection: [Impacts of Modifying the Assessment Schedule on Students' Achievement](#)). They also were 6 months older on average than the students from the same countries assessed in PIRLS 2016, which may also have contributed to increases in achievement between 2016 and 2021 (see Exhibits 2.2.1 and 2.2.2 in [Trends in Reading Achievement](#)). Once again, this lack of comparability and unavailability of control groups from the same 2021 cohort complicates interpreting the trends in achievement at the PIRLS International Benchmarks.

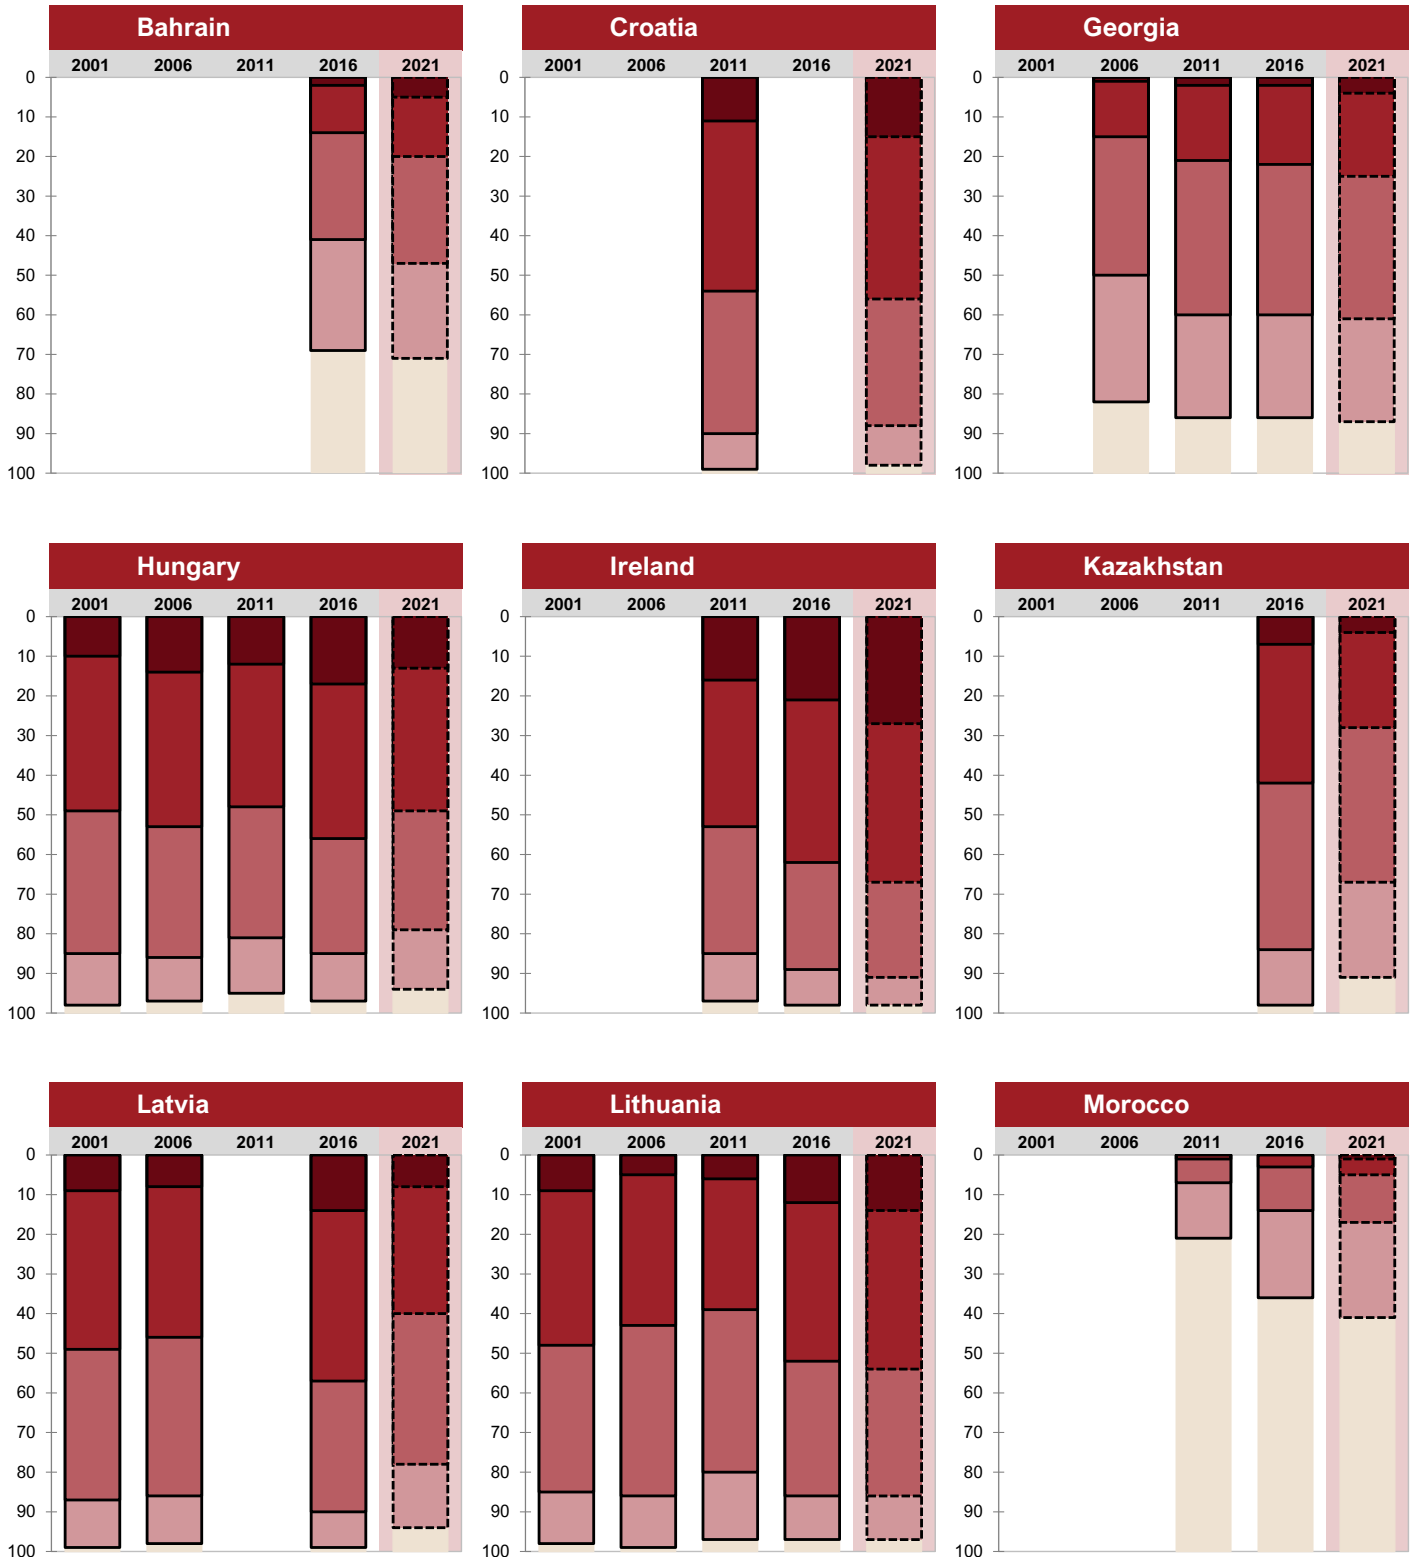

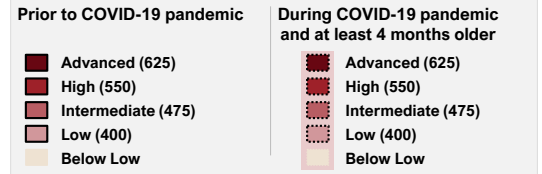

Although 5 of the countries with delayed assessment had increases in the percentage of students reaching the Advanced Benchmark between 2016 and 2021, considering questions about the comparability between 2016 and 2021 (COVID-19 and delayed testing), it is best to have data from 4 or 5 assessment cycles to interpret trends. Looking at the countries with data from at least 4 assessments, Georgia had increases at the Advanced and High Benchmarks, Lithuania and the United States have remained relatively stable, and Hungary and Latvia exhibited fluctuations with declines between 2016 and 2021.

For these 14 countries, it is interesting to consider trends in the percentages of students not reaching the Low Benchmark (“below low”). Several countries, including Morocco, Qatar, and the United Arab Emirates appear to have made steady progress toward more students reaching the Low Benchmark over the last 3 assessments.

Exhibit 4.4: Trends in the Distribution of Students Reaching the PIRLS International Benchmarks

■ Delayed Assessment of Fourth Grade Cohort at the Beginning of Fifth Grade

This exhibit displays changes in percentages of students reaching the PIRLS International Benchmarks in each country and benchmarking participant that assessed fourth grade cohort at the beginning of the fifth grade school year and have data from previous assessments. See Appendix A for country participation in previous assessments.

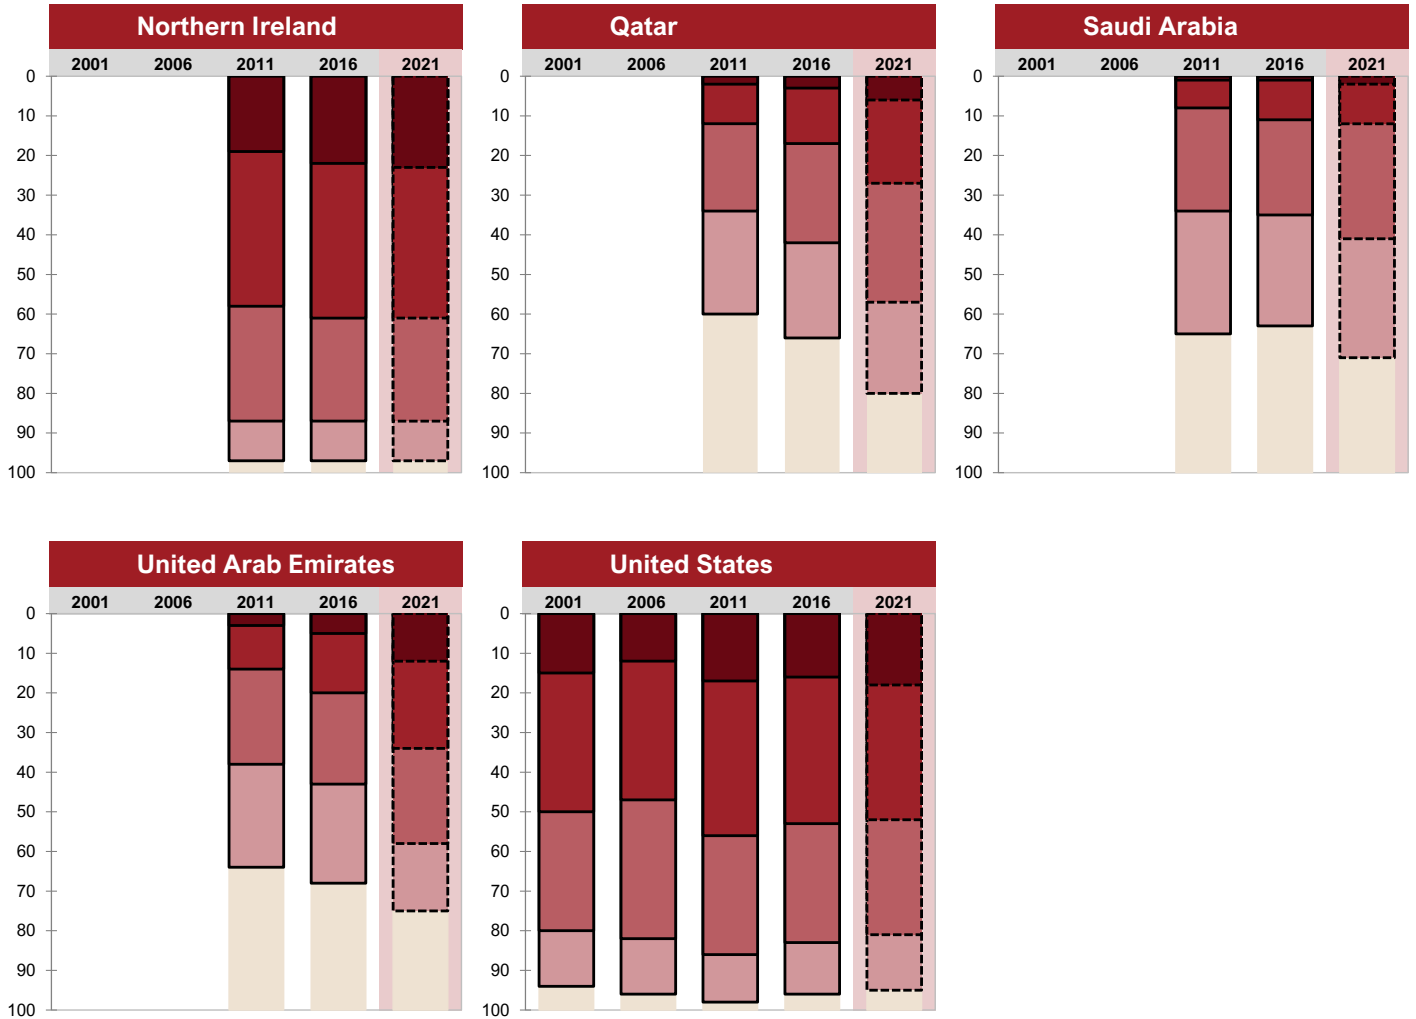

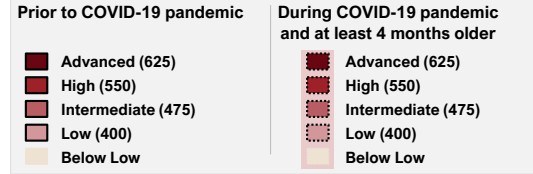

See Appendix A for country participation in previous PIRLS assessments.

Exhibit 4.4: Trends in the Distribution of Students Reaching the PIRLS International Benchmarks

Delayed Assessment of Fourth Grade Cohort at the Beginning of Fifth Grade

(Continued)

This exhibit displays changes in percentages of students reaching the PIRLS International Benchmarks in each country and benchmarking participant that assessed fourth grade cohort at the beginning of the fifth grade school year and have data from previous assessments. See Appendix A for country participation in previous assessments.

Benchmarking Participants

See Appendix A for country participation in previous PIRLS assessments.

SECTION 5

Home Environment Support

All of the data about Home Environment Support were collected from students' parents via the Home Questionnaire, or "Early Learning Survey." The TIMSS & PIRLS International Study Center conducted a series of analyses to establish that there was little or no discernable impact on the responses to the Home Questionnaire due to COVID-19 or delayed testing. However, throughout PIRLS' history, some countries have struggled to attain high participation rates from parents, and some countries have been unable to administer the Home Questionnaire. To caution readers about low response rates, there are designations in the exhibits. If data were available for less than 40 percent of students in a country, the country is designated with a "y," and the data are not reported. If data were available for 40–50 percent of students, the country is designated with an "x," and the data are reported but do not contribute to the International Average.

Many of the PIRLS 2021 Context Questionnaire items were combined into scales measuring a single underlying latent construct related to reading achievement. This section provides results for four scales: *Home Socioeconomic Status*, *Home Early Literacy Activities Before Primary School*, *Parents Like Reading*, and *Could Do Early Literacy Tasks When Beginning Primary School*.

PIRLS used item response theory (IRT) scaling methods, specifically the Rasch partial credit model (PCM), to place items on a scale and produce scale scores (see Chapter 15 in [Methods and Procedures: PIRLS 2021 Technical Report](#)). Each context questionnaire scale enabled students to be classified into regions corresponding to high, middle, and low values on the construct. The "About the Scale" tab associated with each exhibit contains the questionnaire items and describes how the three regions reported in the exhibit were defined in terms of combinations of response categories.

Home Socioeconomic Status

The PIRLS 2021 results contribute to the large body of existing research showing a strong positive relationship between students' socioeconomic environment and their educational achievement.

New for PIRLS 2021, the *Home Socioeconomic Status* scale, or “home SES” scale, was adapted from the *Home Resources for Learning* scale reported in previous PIRLS cycles, which combined data from both fourth grade students and their parents. The updated PIRLS 2021 SES scale is based solely on parents’ data collected using the PIRLS 2021 Home Questionnaire.

As shown in “About the Scale,” the PIRLS 2021 *Home Socioeconomic Status* scale is based on parents’ reports of resources within the home, as well as parental self-reports on education and occupation. Based on the scores for the SES scale, students were placed into three regions—“higher,” “medium,” and “lower” home SES according to their parents’ reports.

Exhibit 5.1 presents for each country the percentages of students classified as having a “higher,” “middle,” or “lower” home SES accompanied by the percentages and average reading achievement of the students in each category. Countries are ordered by the percentage of students with “higher” SES, from highest to lowest.

Internationally, on average, 29 percent of the students were classified as having “higher” home SES, 48 percent with “middle” home SES, and 23 percent with “lower” home SES. Internationally, the results show a large difference of 86 points in average reading achievement between students with “higher” SES and “lower” SES (542 vs. 456). The average reading achievement for students with “middle” SES was 500 scale score points.

This PIRLS context questionnaire scale was established in 2021 based on the combined response distribution of PIRLS 2021 participating countries that assessed fourth grade students at the end of the school year in 2020 or 2021. To provide a point of reference for country comparisons, the scale centerpoint of 10 was located at the mean of the combined distribution. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation of the distribution.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least 70% but less than 85% of the students.

An "s" indicates data are available for at least 50% but less than 70% of the students.

An "x" indicates data are available for at least 40% but less than 50% of the students—interpret with caution.

A "y" indicates data are available for less than 40% of the students.

A tilde (~) indicates insufficient data to report result. A dash (-) indicates comparable data not available.

Exhibit 5.1: Home Socioeconomic Status

Students' Results based on Parents' Reports

About the Scale

Students were scored according to their parents' reports regarding the four indicators on the *Home Socioeconomic Status* scale. Cut scores divide the scale into three categories. Students with **Higher** socioeconomic status had a score at or above the cut score corresponding to their parents reporting they had more than 25 books and more than 25 children's books in their home, that at least one parent finished university, and that at least one parent had a professional occupation, on average. Students with **Lower** socioeconomic status had a score at or below the cut score corresponding to their parents reporting they had 25 or fewer books and 25 or fewer children's books in the home, that neither parent had gone beyond upper secondary education, and that neither parent was a small business owner or worked in a clerical or professional occupation, on average. All other students had **Middle** socioeconomic status.

Number of books in the home:

- 1) 0–10
- 2) 11–25
- 3) 26–100
- 4) 101–200
- 5) More than 200

Number of children's books in the home:

- 1) 0–10
- 2) 11–25
- 3) 26–50
- 4) 51–100
- 5) More than 100

Highest level of education of either parent:

- 1) Finished some primary or lower secondary or did not go to school
- 2) Finished lower secondary
- 3) Finished upper secondary
- 4) Finished post-secondary education
- 5) Finished university or higher

Highest level of occupation of either parent:

- 1) Has never worked outside home for pay, general laborer, or semi-professional (skilled agricultural or fishery worker, craft or trade worker, plant or machine operator)
- 2) Clerical (clerk or service or sales worker)
- 3) Small business owner
- 4) Professional (corporate manager or senior official, professional, or technician or associate professional)

Home Early Literacy Activities Before Primary School

The *Home Early Literacy Activities Before Primary School* scale is based on parents' reports of how often they engaged their child in nine early literacy activities before primary school (see "About the Scale"). Based on the scale response categories and IRT scores, students in the "often" category had parents that frequently engaged them in such activities as reading books, telling stories, talking with them, playing word games, or writing. In comparison, students whose parents reported doing these activities never or only sometimes were placed in the "never or almost never" category. All of the other students "sometimes" were engaged in early literacy activities.

Exhibit 5.2 presents the percentages of students in each participating country whose parents reported they engaged their children in these activities "often," "sometimes," or "never or almost never" together with the students' average reading achievement for each of the three categories. Countries are ordered by the percentage of students whose parents engaged them in these activities "often."

Internationally on average, 42 percent of students had parents that engaged them in these early literacy activities "often" and another 55 percent were engaged in the activities "sometimes." Only a very small percentage of students (3% on average) were "never or almost never" engaged in these activities. Engaging more frequently in literacy activities with young children appears to have a considerable impact on their reading achievement at the fourth grade. Average reading achievement was highest (517) for students whose parents "often" engaged them in these activities and noticeably lower (494) for students whose parents only "sometimes" engaged them in these activities. The average achievement was much lower (418) for the small percentage of students whose parents "never or almost never" engaged them in early literacy activities.

This PIRLS context questionnaire scale was established in 2011 based on the combined response distribution of countries that participated in PIRLS 2011. To provide a point of reference for country comparisons, the scale centerpoint of 10 was located at the mean of the combined distribution. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation of the distribution.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least 70% but less than 85% of the students.

An "s" indicates data are available for at least 50% but less than 70% of the students.

An "x" indicates data are available for at least 40% but less than 50% of the students—interpret with caution.

A "y" indicates data are available for less than 40% of the students.

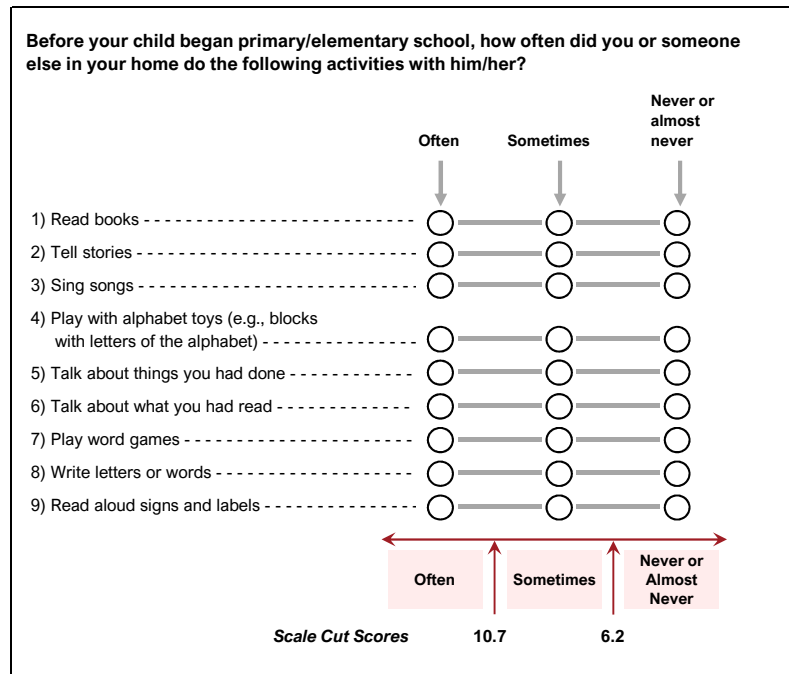

A tilde (~) indicates insufficient data to report result. A dash (-) indicates comparable data not available.

Exhibit 5.2: Home Early Literacy Activities Before Primary School

Students' Results based on Parents' Reports

About the Scale

Students were scored according to their parents' reports regarding the frequency they or someone in the home engaged their children in the nine activities on the *Early Literacy Activities* scale. Cut scores divide the scale into three categories. Students who **Often** engaged in early literacy activities before primary school had a score at or above the cut score corresponding to their parents reporting they "often" did five of the nine activities and "sometimes" did the other four, on average. Students who **Never or Almost Never** engaged in early literacy activities before primary school had a score at or below the cut score corresponding to their parents reporting they "never or almost never" did five of the nine activities and "sometimes" did the other four, on average. All other students **Sometimes** engaged in early literacy activities before primary school.

Parents Like Reading

Young students who see adults and older children reading or using texts in a variety of different ways can learn to model these behaviors. In PIRLS 2021, students whose parents reported liking to read had higher average reading achievement than students whose parents were more ambivalent about reading.

The *Parents Like Reading* scale is based on parents' degree of agreement with a series of eight statements about reading enjoyment (such as "I like to spend my spare time reading." and "I would like to have more time for reading."), as well as their reports of how often they read for enjoyment (for further information see "About the Scale"). Based on their parents' responses, students were placed in three regions of the scale: "very much like," "somewhat like," or "do not like."

Exhibit 5.3 presents the percentages and average reading achievement of students whose parents reported that they "very much like," "somewhat like," or "do not like" reading. Countries are ordered according to the percentage of students whose parents "very much like" reading, from highest to lowest.

The results indicate a positive association between parents' liking to read and their children having higher reading achievement at the fourth grade. Across the PIRLS 2021 countries, on average, 30 percent of students whose parents "very much like" reading had higher average achievement than the 52 percent of the students whose parents only "somewhat like" reading (524 vs. 497, respectively). In turn, 17 percent of students whose parents "do not like" reading had the lowest average reading achievement (478).

Exhibit 5.3: Parents Like Reading

Students' Results based on Parents' Reports

About the Scale

Students were scored on the *Parents Like Reading* scale according to their parents' responses to eight statements about reading as well as how often they read for enjoyment. Cut scores divide the scale into three categories. Students whose parents **Very Much Like Reading** had a score at or above the cut score corresponding to their parents "agreeing a lot" with four of the eight statements and "agreeing a little" with the other four, as well as reading for enjoyment "every day or almost every day," on average. Students whose parents **Do Not Like Reading** had a score at or below the cut score corresponding to their parents "disagreeing a little" with four of the eight statements and "agreeing a little" with the other four, as well as reading for enjoyment only "once or twice a month," on average. All other students had parents who **Somewhat Like Reading**.

Please indicate how much you agree with the following statements about reading.

	Agree a lot	Agree a little	Disagree a little	Disagree a lot

Could Do Early Literacy Tasks When Beginning Primary School

The *Could Do Early Literacy Tasks When Beginning Primary School* scale is based on parents' reports of how well their child could do six literacy tasks when their child began the first grade of primary school. For example, parents were asked how well their children could read sentences, read stories, or write words. Consistent with existing research, the PIRLS 2021 results show that students with an early start in literacy learning had higher average reading achievement at the fourth grade.

Exhibit 5.4 presents the percentages of students who could do early literacy tasks “very well,” “moderately well,” and “not well” when they began the first grade of primary school based on their parents' reports, together with the students' average reading achievement. Countries are listed in descending order by the percentage of students who could do the tasks “very well.”

Across countries, on average, similar percentages of students could do the early literacy tasks “very well” (32%), “moderately well” (35%), or “not well” (34%) before beginning primary school. Literacy readiness when beginning primary school was associated with higher reading achievement at the fourth grade. On average, students who could do the early literacy tasks “very well” when they began primary school had higher average reading achievement at fourth grade (524) than students who could do the early literacy tasks “moderately well” (498). The students in the “not well” category had the lowest average achievement (475).

This PIRLS context questionnaire scale was established in 2011 based on the combined response distribution of countries that participated in PIRLS 2011. To provide a point of reference for country comparisons, the scale centerpoint of 10 was located at the mean of the combined distribution. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation of the distribution.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least 70% but less than 85% of the students.

An "s" indicates data are available for at least 50% but less than 70% of the students.

An "x" indicates data are available for at least 40% but less than 50% of the students—interpret with caution.

A "y" indicates data are available for less than 40% of the students.

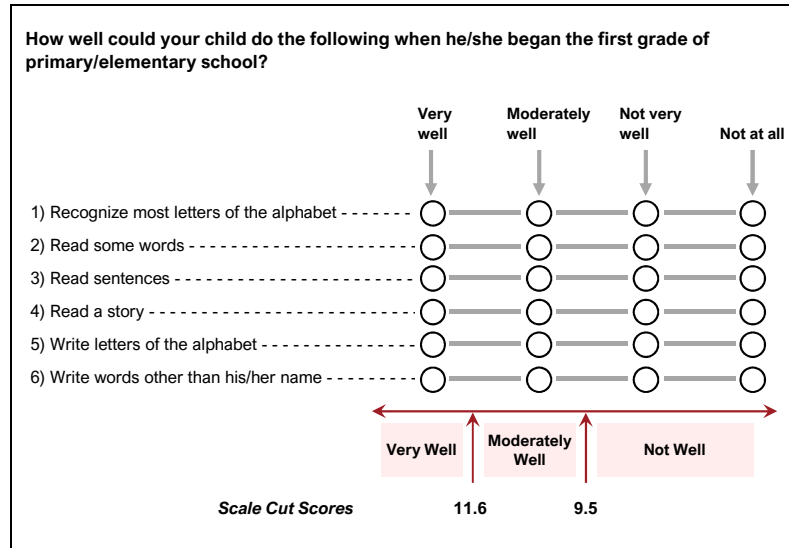

A dash (-) indicates comparable data not available.

Exhibit 5.4: Could Do Early Literacy Tasks When Beginning Primary School

Students' Results based on Parents' Reports

About the Scale

Students were scored according to their parents' reports regarding how well their children could do the six tasks on the *Early Literacy Tasks* scale when they began primary school. Cut scores divide the scale into three categories. Students who could do the tasks **Very Well** had a score at or above the cut score corresponding to their parents reporting the students could do three of the six tasks "very well" and the other three "moderately well," on average. Students who could do the tasks **Not Well** had a score at or below the cut score corresponding to their parents reporting the students could do three of the six tasks "not very well" and the other three "moderately well," on average. All other students could do the early literacy tasks **Moderately Well** when they began primary school.

SECTION 6

School Composition, Resources, and Climate

The data in this section about School Composition, Resources, and Climate were collected from school principals via the PIRLS 2021 School Questionnaire. In countries where the assessment of the fourth grade cohort was delayed to the beginning of the fifth year of schooling, typically the schools had both fourth and fifth grades and principals were asked to answer in terms of the fourth grade cohort from the previous school year. The TIMSS & PIRLS International Study Center conducted a series of analyses to establish that there was little or no discernable impact in the responses to the School Questionnaire due to COVID-19 or delayed testing.

Many of the PIRLS 2021 Context Questionnaire items were combined into scales measuring a single underlying latent construct related to reading achievement. This section provides results for three scales: *Instruction Affected by Reading Resource Shortages*, *School Emphasis on Academic Success*, and *School Discipline*.

PIRLS used item response theory (IRT) scaling methods, specifically the Rasch partial credit model (PCM), to place items on a scale and produce scale scores (see Chapter 15 in [Methods and Procedures: PIRLS 2021 Technical Report](#)). Each context questionnaire scale enabled students to be classified into regions corresponding to high, middle, and low values on the construct. The “About the Scale” tab associated with each exhibit contains the questionnaire items and describes how the three regions reported in the exhibit were defined in terms of combinations of response categories.

Socioeconomic Background of the Student Body

PIRLS asked school principals to estimate the percentages of economically affluent and economically disadvantaged students in the school. As described in “About the Index,” the principals’ reports were combined to characterize schools as “more affluent,” “neither more affluent nor more disadvantaged,” or “more disadvantaged.”

For each country, Exhibit 6.1 presents the percentages of fourth grade students attending schools in each of the three categories of socioeconomic composition together with the students’ average reading achievement. On average, 43 percent of

students attended schools with relatively “more affluent” students than disadvantaged students and 25 percent attended schools with relatively “more disadvantaged” than affluent students. The remaining 32 percent of students attended schools classified as “neither more affluent nor more disadvantaged.”

Consistent with the results of considerable research, PIRLS 2021 found that students who attended schools with higher proportions of economically affluent students had higher reading achievement than students attending schools with lower proportions of economically affluent students. The average achievement was highest for students in the “more affluent” schools and lowest in the “more disadvantaged” schools (521 and 479, respectively). Average reading achievement for students attending “neither more affluent nor more disadvantaged” schools was in the middle—502 scale score points, on average.

Students Begin Primary Grades with Literacy Skills

To provide information about students' foundation for formal reading instruction when they began school, PIRLS asked principals about how many students in the school have basic literacy skills (e.g., write the alphabet, write sentences) when they begin the primary grades—less than 25%, 25–50%, 51–75%, or more than 75%.

Exhibit 6.2 presents the average percentages of students attending schools with each of the four amounts of students having basic literacy skills when they begin primary school together with the students' average reading achievement. The country-by-country results are ordered from highest to lowest according to the percentage of students in schools with “more than 75%” of students beginning with basic literacy skills, and there was considerable variation across countries. This variation might be related to a number of factors, such as students' home SES, countries' policies on preprimary school attendance, or the age of entry to primary school (see Curriculum Questionnaire results in the [PIRLS 2021 Encyclopedia](#)).

On average across countries, 26 percent of students were in schools where “more than 75%” of students begin the primary grades with literacy skills, 19 percent were in schools where “51–75%” of students begin with literacy skills, 22 percent were in schools where “25–50%” of students begin with literacy skills, and 33 percent were in schools where “less than 25%” of students begin with literacy skills.

In general, average reading achievement was higher for fourth grade students in schools where greater percentages of students begin primary school equipped with basic literacy skills. Students who attended schools where “more than 75%” of students begin the primary grades with basic literacy skills had the highest average achievement (511), followed by “51–75%” with basic literacy skills (503). Students in schools where fewer students begin school with basic literacy skills—“25–50%” and “less than 25%”—had somewhat lower average reading achievement (495 and 491, respectively).

Instruction Affected by Resource Shortages

The PIRLS 2021 *Instruction Affected by Reading Resources* scale summarizes principals' reports about how much two kinds of resource shortages affect instruction: general school resources and resources specific to reading instruction. Students were categorized according to three levels of resource shortages experienced by their school—"not affected," "somewhat affected," and "affected a lot" (see "About the Scale").

In Exhibit 6.3, countries are ordered by the percentage of fourth grade students in schools "not affected" by resource shortages. There was a positive association between the availability of resources and fourth grade students' reading achievement. On average, 31 percent of students attended schools "not affected" by resource shortages, and they had the highest average reading achievement (519). Average reading achievement was comparatively lower for the 61 percent of students in schools "somewhat affected" by resource shortages (498) and even lower for the 8 percent of students in schools "affected a lot" by resource shortages (472).

This PIRLS context questionnaire scale was established in 2011 based on the combined response distribution of countries that participated in PIRLS 2011. To provide a point of reference for country comparisons, the scale centerpoint of 10 was located at the mean of the combined distribution. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation of the distribution.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least 70% but less than 85% of the students.

An "s" indicates data are available for at least 50% but less than 70% of the students.

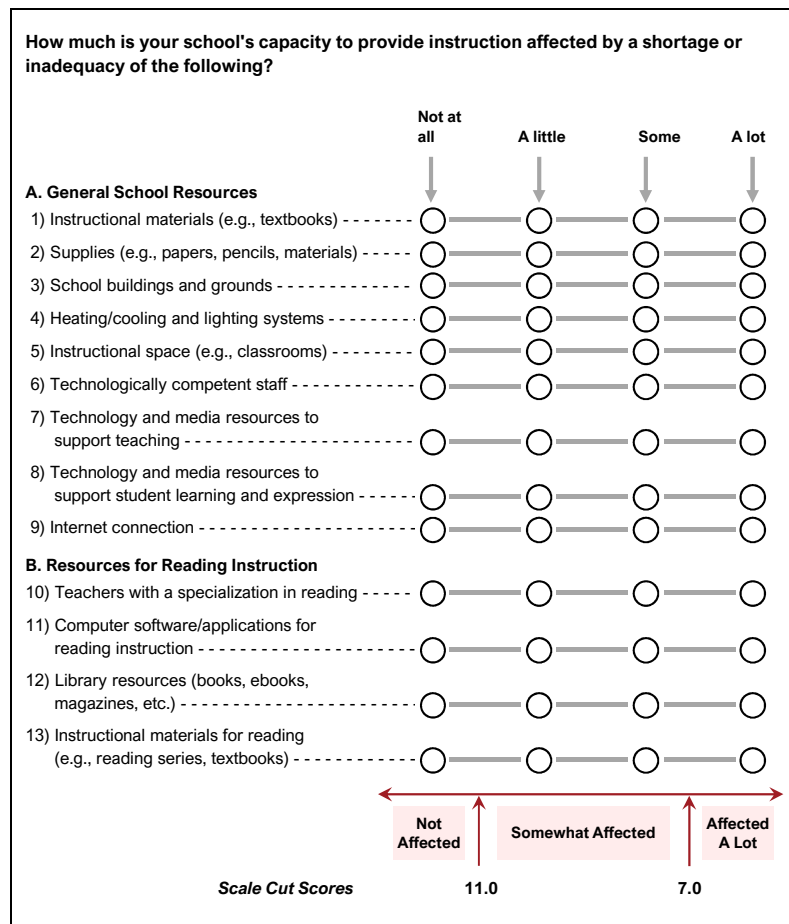

A tilde (~) indicates insufficient data to report result.

Exhibit 6.3: Instruction Affected by Reading Resource Shortages – Principals' Reports

Students' Results based on Principals' Reports

About the Scale

Students were scored according to their principals' responses regarding thirteen school and classroom resources on the *Instruction Affected by Reading Resource Shortages* scale. Cut scores divide the scale into three categories. Students in schools where instruction was **Not Affected** by resource shortages had a score at or above the cut score corresponding to their principals reporting that shortages affected instruction "not at all" for seven of the thirteen resources and "a little" for the other six, on average. Students in schools where instruction was **Affected A Lot** had a score at or below the cut score corresponding to their principals reporting that shortages affected instruction "a lot" for seven of the thirteen resources and "some" for the other six, on average. All other students attended schools where instruction was **Somewhat Affected** by resource shortages.

School Emphasis on Academic Success

The *School Emphasis on Academic Success* scale was administered to school principals of fourth grade students to collect information about their schools' expectations regarding academic achievement. Based on the IRT scaling, students were placed into three categories according to their principals' responses regarding 12 aspects of the school climate oriented toward academics (see the description in "About the Scale"). Consistent with previous PIRLS results, principals in PIRLS 2021 reported a high degree of emphasis on academics in their schools, so the three categories are described as "very high," "high," and "medium" emphasis.

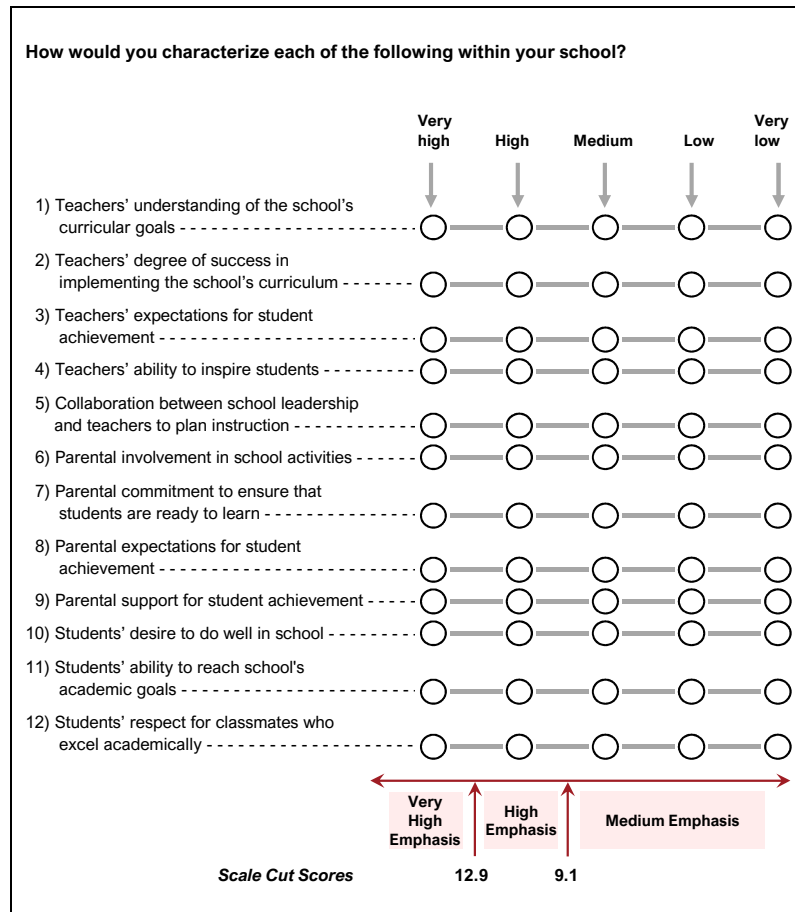

Exhibit 6.4 shows countries' results, ordered according to the percentage of students attending schools in the "very high emphasis" category from highest to lowest. Across countries, on average, 10 percent of fourth grade students attended schools where the principal reported a "very high emphasis" on academic success, 58 percent attended schools with a "high emphasis," and 32 percent attended schools with a "medium emphasis." Students who attended schools with a higher emphasis on academic success had higher average reading achievement. Students in the "very high emphasis" category had the highest average achievement (525), followed by the "high emphasis" category (509). Students in the "medium emphasis" category had the lowest average reading achievement (486).

Exhibit 6.4: School Emphasis on Academic Success – Principals' Reports

Students' Results based on Principals' Reports

About the Scale

Students were scored according to their principals' responses characterizing twelve aspects on the *School Emphasis on Academic Success* scale. Cut scores divide the scale into three categories. Students in schools with a **Very High Emphasis** on academic success had a score at or above the cut score corresponding to their principals characterizing six of the twelve aspects as "very high" and the other six as "high," on average. Students in schools with a **Medium Emphasis** on academic success had a score at or below the cut score corresponding to their principals characterizing six of the twelve aspects as "medium" and the other six as "high," on average. All other students attended schools with a **High Emphasis** on academic success.

School Discipline

Exhibit 6.5 presents the results of the PIRLS 2021 *School Discipline* scale. The PIRLS 2021 School Questionnaire asked school principals for their perceptions about the extent that ten discipline, disorder, and bullying behaviors were problems among fourth grade students in their school. In countries where the assessment of the fourth grade cohort was delayed to the beginning of the fifth year of schooling, principals were asked to answer in terms of the fourth grade cohort from the previous school year. As detailed in the “About the Scale,” IRT was used to create scale scores and students were categorized as attending three types of schools regarding discipline and safety, those with “hardly any problems,” “minor problems,” or “moderate to severe problems.”

In Exhibit 6.5, the countries’ results are presented according to the percentage of students in schools where principals reported “hardly any problems” with discipline and safety, from highest to lowest. On average, across countries, the majority of fourth grade students (64%) attended schools with “hardly any problems,” and 27 percent attended schools with “minor problems.” Although there was considerable variation across countries, only 9 percent of students, on average, attended schools where principals reported “moderate to severe problems” with discipline and safety.

Considerable research has shown that a higher degree of school safety is associated with higher student achievement. Consistent with this research and previous PIRLS assessments, PIRLS 2021 found that average reading achievement was relatively higher for students in schools with “hardly any problems” than for students in schools with “minor problems” (510 vs. 493). Average reading achievement for students who attended schools having “moderate to severe problems” with school discipline was 465, substantially lower (28 points) than for students in schools with “minor problems.”

This PIRLS context questionnaire scale was established in 2011 based on the combined response distribution of countries that participated in PIRLS 2011. To provide a point of reference for country comparisons, the scale centerpoint of 10 was located at the mean of the combined distribution. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation of the distribution.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least 70% but less than 85% of the students.

An "s" indicates data are available for at least 50% but less than 70% of the students.

A tilde (~) indicates insufficient data to report result.

Exhibit 6.5: School Discipline – Principals’ Reports

Students’ Results based on Principals’ Reports

About the Scale

Students were scored according to their principals’ reports regarding ten potential problems on the *School Discipline* scale. Cut scores divide the scale into three categories. Students in schools with **Hardly Any Problems** had a score at or above the cut score corresponding to their principals reporting that five of the ten issues are a “not a problem” and the other five are a “minor problem,” on average. Students in schools with **Moderate to Severe Problems** had a score at or below the cut score corresponding to their principals reporting that five of the ten issues are a “moderate problem” and the other five are a “minor problem,” on average. All other students were in schools with **Minor Problems**.

SECTION 7

Students' Reading Attitudes and Behaviors

The results in this section about Students' Reading Attitudes and Behaviors are based on students' responses to the PIRLS 2021 Student Questionnaire. The TIMSS & PIRLS International Study Center conducted a series of analyses to establish that there was little or no discernable impact in the responses to the Student Questionnaire due to COVID-19 or delayed testing. The exhibits include the results for all 57 countries and 8 benchmarking entities that participated in PIRLS 2021 (with the 14 countries that delayed testing highlighted in pink).

Many of the PIRLS 2021 Context Questionnaire items were combined into scales measuring a single underlying latent construct related to reading achievement. This section provides results for two scales: *Students Like Reading* and *Students Confident in Reading*.

PIRLS used item response theory (IRT) scaling methods, specifically the Rasch partial credit model (PCM), to place items on a scale and produce scale scores (see Chapter 15 in [Methods and Procedures: PIRLS 2021 Technical Report](#)). Each context questionnaire scale enabled students to be classified into regions corresponding to high, middle, and low values on the construct. The "About the Scale" tab associated with each exhibit contains the questionnaire items. It also describes how the three regions reported in the exhibit were defined in terms of combinations of response categories.

PIRLS assessments have contributed to a considerable body of research showing that students with positive attitudes toward reading typically have higher reading achievement. However, it is unclear whether students' positive attitudes toward reading lead to higher reading achievement or whether their positive attitudes result from higher reading achievement. There is evidence in the reading research literature that attitudes and reading achievement have a reciprocal rather than a causal relationship.

Students Like Reading

To create the *Students Like Reading* scale, PIRLS asked students how much they agreed with a series of eight statements about their attitudes toward reading and two items about how often they read outside of school (the items are provided in “About the Scale”). PIRLS used IRT scaling to summarize the results and then classified students into three regions on the scale, “very much like reading,” “somewhat like reading,” and “do not like reading.”

Exhibit 7.1 presents the *Students Like Reading* scale results for the PIRLS 2021 countries, including the percentages of students classified into the three levels of attitudes toward reading (from positive to negative) together with their average achievement. The results are ordered by the percentage of students who reported they “very much like reading” (from highest to lowest). In general, fourth grade students had positive attitudes about reading—42 percent, on average, reported they “very much like reading” and another 40 percent reported that they “somewhat like reading.” However, as a matter of some concern in today’s information-driven society, 18 percent of these young students, on average, responded negatively that they “do not like reading.”

There was a modest relationship between liking reading and reading achievement at the fourth grade. Students who responded that they “do not like reading” had lower average reading achievement (491) than students who “very much like reading” (513) and students who “somewhat like reading” (501).

Students' Reports

About the Scale

Students were scored on the *Students Like Reading* scale according to their degree of agreement with eight statements and how often they did two reading activities outside of school. Students who **Very Much Like Reading** had a score at or above the cut score corresponding to "agreeing a lot" with four of the eight statements and "agreeing a little" with the other four, as well as doing one of the two reading activities outside of school "every day or almost every day," on average. Students who **Do Not Like Reading** had a score at or below the cut score corresponding to "disagreeing a little" with four of the eight statements and "agreeing a little" with the other four, as well as doing one of two the reading activities only "once or twice a month," on average. All other students **Somewhat Like Reading**.

What do you think about reading? Tell how much you agree with each of these statements.

	Agree a lot	Agree a little	Disagree a little	Disagree a lot
1) I like talking about what I read with other people -----	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
2) I would be happy if someone gave me a book as a present -----	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
3) I think reading is boring ^R -----	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
4) I would like to have more time for reading -----	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
5) I enjoy reading -----	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
6) I learn a lot from reading -----	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
7) I like to read things that make me think -----	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
8) I like it when a book helps me imagine other worlds -----	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Exhibit 7.2 reports results for the *Students Like Reading* scale by gender, with countries ordered according to the difference between the percentage of girls and the percentage of boys who “very much like reading” from lowest to highest. Across countries in general, higher percentages of girls than boys responded that they “very much like reading,” on average—46 percent of girls vs. 37 percent of boys.

Students Confident in Reading

The PIRLS 2021 *Students Confident in Reading* scale asked students how much they agreed with six statements about how well they can read. Based on their responses, students were classified according to the degree of confidence they had in their own reading ability—“very confident in reading,” “somewhat confident in reading,” or “not confident in reading” (see “About the Scale”).

For the PIRLS 2021 countries, Exhibit 7.3 presents the percentages of students in each of the three categories of confidence in reading along with their average reading achievement. Internationally on average, 43 percent of students reported being “very confident in reading,” 35 percent of students were “somewhat confident in reading,” and 22 percent were “not confident in reading.”

The results of the PIRLS 2021 *Students Confident in Reading* scale show that the fourth grade students have an accurate self-assessment of their own level of reading skills as measured by PIRLS. Fourth grade students who reported being “very confident in reading” had relatively high average achievement (541), similar to almost reaching the High International Benchmark (550) of reading achievement (see report section on [International Benchmarks](#)). Those who were “somewhat confident in reading” had mid-range achievement on average (498), and those who were “not confident in reading” had an average achievement of 449, which falls short of reaching the Intermediate International Benchmark (475).

Exhibit 7.3: Students Confident in Reading

Students' Reports

Assessed Fourth Grade Students at the End of the School Year

☒ Assessed one year later than originally scheduled

☐ Delayed Assessment of Fourth Grade Cohort at the Beginning of Fifth Grade

This PIRLS context questionnaire scale was established in 2016 based on the combined response distribution of countries that participated in PIRLS 2016. To provide a point of reference for country comparisons, the scale centerpoint of 10 was located at the mean of the combined distribution. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation of the distribution.

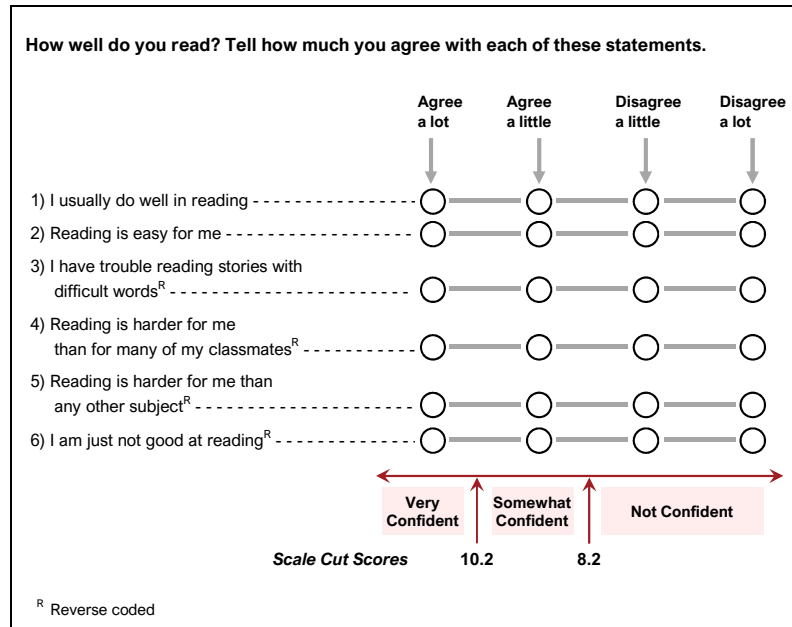

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.
An "r" indicates data are available for at least 70% but less than 85% of the students.

Exhibit 7.3: Students Confident in Reading

Students' Reports

About the Scale

Students were scored according to their responses to six statements on the *Students Confident in Reading* scale. Cut scores divide the scale into three categories. Students **Very Confident in Reading** had a score at or above the cut score corresponding to “agreeing a lot” with three of the six statements and “agreeing a little” with the other three, on average. Students who were **Not Confident in Reading** had a score at or below the cut score corresponding to “disagreeing a little” with three of the six statements and “agreeing a little” with the other three, on average. All other students were **Somewhat Confident in Reading**.

Exhibit 7.4 shows the results for the *Students Confident in Reading* scale separately for girls and for boys. On average, across countries, there was little difference between the percentages of girls and boys in each of the scale categories—46 percent of girls and 40 percent of boys reported being “very confident in reading,” 34 percent of girls and 35 percent of boys were “somewhat confident,” and 19 percent of girls and 25 percent of boys were “not confident.” However, there was considerable variation across countries in the magnitude of the difference between the percentage of girls and the percentage of boys classified as “very confident in reading,” ranging from little or no difference in Belgium (French), Hong Kong SAR, Denmark, Macao SAR, and Brazil to an 18 percentage point difference favoring girls in Saudi Arabia.

This PIRLS context questionnaire scale was established in 2016 based on the combined response distribution of countries that participated in PIRLS 2016. To provide a point of reference for country comparisons, the scale centerpoint of 10 was located at the mean of the combined distribution. The units of the scale were chosen so that 2 scale score points corresponded to the standard deviation of the distribution.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.
An "r" indicates data are available for at least 70% but less than 85% of the students.

Students Use Digital Devices to Find and Read Information

Students participating in PIRLS 2021 were asked to indicate how much time they spent using a computer, tablet, or smartphone to find and read information for schoolwork on a normal school day. Interpreting the results depends on a number of factors, including the regularity of schoolwork that involves searching for information, the difficulty of the searches, students' personal interests, and their inclination to not become distracted by extraneous information.

Exhibit 7.5 presents the countries' results in alphabetic order together with average achievement for three categories of time spent—"more than 30 minutes per school day," "30 minutes or less per school day," and "no time per school day."

On average, about half the students (52%) were in the middle category of time spent, spending "30 minutes or less per school day" using digital devices to find and read information, and these students had the highest average reading achievement (512). Relatively fewer students reported spending either "more than 30 minutes" (25%) or "no time" (23%) per school day finding and reading digital information. The students who reported spending the most time, "more than 30 minutes per school day," had somewhat lower achievement (502) than those that spent "30 minutes or less," which could indicate a number of situations (e.g., they were assigned extra practice work, were just slower readers, or spent more time becoming distracted). The students who reported spending "no time" had the lowest average achievement (486). This finding about the distribution of digital device use and associated achievement is consistent with other research (e.g., Bundsgaard & Gerick, 2017¹).

¹ Bundsgaard, J., & Gerrick, J. (2017). Patterns of students' computer use and relations to their computer and information literacy: results of a latent class analysis and implications for teaching and learning. *Large-scale Assessments in Education*, 5(16), 1-15.

About the Item	
How much time do you spend using a computer, tablet, or smartphone to <i>find and read information</i> for your <u>schoolwork</u> on a normal school day?	
No time ----	<input type="radio"/>
30 minutes or less ----	<input type="radio"/>
More than 30 minutes ----	<input type="radio"/>

SOURCE: IEA's Progress in International Reading Literacy Study - PIRLS 2021
Downloaded from <https://pirls2021.org/results>

Exhibit 7.6 shows that on average, the results for the time spent using digital devices to find and read information on a normal school day were similar for girls and boys, but with somewhat more girls in the middle time spent category—“30 minutes or less per school day” (56% vs. 49%). On average, 24 percent of girls reported spending “more than 30 minutes” per school day using digital devices to find and read information, 56 percent reported “30 minutes or less,” and 21 percent reported “no time.” In comparison, 27 percent of boys reported spending “more than 30 minutes” per school day, 49 percent reported spending “30 minutes or less,” and 25 percent reported spending “no time.”

APPENDIX A

Population Coverage and Sample Participation Rates

Exhibit A.1: Information About the Students Assessed in PIRLS 2021

Assessed Fourth Grade Students at the End of the School Year

☒ Assessed one year later than originally scheduled

☐ **Delayed Assessment of Fourth Grade Cohort at the Beginning of Fifth Grade**

The PIRLS target population is the grade that represents four years of schooling counting from the first year of ISCED Level 1. In 6 countries, delayed test administration due to COVID-19 occurred a full year later at the end of the fourth year of schooling for the next cohort (☒). In 14 Northern Hemisphere countries, delayed test administration occurred half a year later at the beginning of the fifth year of schooling (☐).

IEA has a policy that students do not fall under the minimum average age of 9.5 years old at the time of testing, so England, Malta, and New Zealand assessed students in their fifth year of formal schooling. Norway chose to assess students in the fifth year of schooling so students would be compared with similar age students in Sweden, Denmark, and Finland.

Average age at the time of testing can vary across countries by just over a year (e.g., from 9.8 to 10.9 years) depending on a country's policy on age of entry to school and dates of test administration. For information on age of entry policy and practice, see Exhibit 2 of the *PIRLS 2021 Encyclopedia*.

Country	Country's Name for Fourth Year of Schooling*	Data Collection Period	Average Age at Time of Testing (Years)
Albania	Grade 4	March–April 2021	10.0
Australia ☒	Year 4	September–December 2021	10.0

Students attending a sampled class at the time the sample was chosen but leaving the class before the assessment was administered were classified as "withdrawn."

Students with a disability or language barrier that prevented them from participating in the assessment were classified as "excluded."

Students not present when the assessment was administered, and not subsequently assessed in a make-up session, were classified as "absent."

PIRLS guidelines for sampling participation: The minimum acceptable participation rates were 85 percent of schools, 95 percent of classes, and 85 percent of students, or a combined rate (the product of school, class, and student participation) of 75 percent.

Participants not meeting these guidelines were annotated as follows:

† Met guidelines for sample participation rates only after replacement schools were included

‡ Nearly satisfied guidelines for sample participation rates after replacement schools were included

≡ Did not satisfy guidelines for sample participation rates

APPENDIX C

Organizations and Individuals Responsible for PIRLS 2021

Introduction

PIRLS 2021 was a collaborative effort involving hundreds of individuals around the world. This appendix acknowledges the key individuals and organizations for their contributions. Given that the work on PIRLS 2021 spanned more than five years and involved so many people and organizations, this is not a comprehensive list of everyone who contributed. PIRLS 2021 also acknowledges the students, parents, teachers, and school principals who contributed their time and effort to the study. This report would not be possible without them.

Management and Coordination

PIRLS is a major undertaking of IEA, and together with the Trends in International Science and Mathematics Study (TIMSS), comprises the core of IEA's regular cycles of studies. The PIRLS assessment at the fourth grade complements TIMSS, which regularly assesses mathematics and science achievement at the fourth and eighth grades.

PIRLS 2021 was conducted by IEA's TIMSS & PIRLS International Study Center, which is responsible for the overall direction and management of TIMSS and PIRLS, including design, development, and implementation. Headed by Executive Directors Drs. [Ina V.S. Mullis](#) and [Matthias von Davier](#), the study center is located in the Lynch School of Education and Human Development at Boston College. The TIMSS & PIRLS International Study Center worked closely with IEA Amsterdam, which was responsible for country participation, verification of all translations produced by the participating countries, and coordinating school visits for the International Quality Control Monitors. In addition, staff at IEA Hamburg worked with participating countries to organize sampling and data management operations and to check all data for accuracy and consistency within and across countries. Statistics Canada in Ottawa was responsible for school and student sampling activities.

The Project Management Team, comprising the study directors and representatives from the TIMSS & PIRLS International Study Center, IEA Amsterdam, IEA Hamburg, and Statistics Canada met twice a year throughout the study to discuss the study's progress, procedures, and schedule. In addition, the study directors met with members of IEA's Technical Executive Group twice each year to review technical issues.

To work with the international team and coordinate within-country activities, each participating country designates an individual to be the PIRLS National Research Coordinator (NRC). The NRCs have the challenging task of implementing PIRLS in their countries in accordance with the PIRLS guidelines and procedures. In addition, the NRCs contribute to the development of PIRLS and provide input throughout the course of the project. The quality of the PIRLS assessment and data depends on the work of the NRCs and their colleagues in carrying out the complex sampling, data collection, and scoring tasks. The PIRLS 2021 NRCs worked tirelessly to support PIRLS 2021 data collection despite the difficult circumstances presented by the COVID-19 pandemic. They performed their many tasks with dedication, competence, energy, and goodwill. PIRLS 2021 owes its success to the commitment and determination of the NRCs and their colleagues.

Funding

Funding for PIRLS 2021 was provided primarily by the participating countries. Boston College also is gratefully acknowledged for its generous financial support and stimulating educational environment.

TIMSS & PIRLS International Study Center at Boston College

Ina V.S. Mullis, *Executive Director*

Matthias von Davier, *Executive Director*

Michael O. Martin, *Executive Director (through 2021)*

Pierre Foy, *Senior Director, Sampling, Psychometrics, and Data Analysis*

Ieva Johansone, *Senior Director, Operations and Quality Control*

Ann Kennedy, *Senior Director, Project Management (from 2022)*

Paul Connolly, *Director, Graphic Design and Publications*

Dana Kelly, *Director, Development and Reporting (through 2021)*

Sonia Baron, *Graduate Assistant*

Ummugul Bezirhan, *Senior Research Specialist, Measurement and Data Analysis*

Marcie Bligh, *Manager, Events and Administration*

Alicia Bouchard, *Administrative Assistant*

Jessie Bristol, *Research Specialist, Measurement and Data Analysis*

Susan Farrell, *Lead Web and Database Designer*

Bethany Fishbein, *Assistant Director, Psychometrics and Data Analysis*

Susan Flicop, *Research Specialist, Operations and Quality Control*

Christine Hoage, *Manager of Finance (through 2021)*

Joan King, *Manager of Finance (from 2022)*

Maya Komakhidze, *Graduate Assistant*

Dihao Leng, *Graduate Assistant*

Jenny Liu, *Research Specialist, Questionnaire Development and Policy Research (through 2019)*

Tianzheng Mao, *Research Associate, Measurement and Data Analysis (from 2022)*

Anne McCarthy, *Front-End Web Developer (through 2022)*

Mario Pita, *Lead Graphic Designer*

Sean Quinn, *Senior Front-End Web Developer (from 2022)*

Katherine Reynolds, *Assistant Director, Questionnaire Development and Policy Research*

Ruthanne Ryan, *Senior Graphic Designer*

Erin Shaw, *Research Associate, Reporting and Communications*

Steven A. Simpson, *Senior Graphic Designer (through 2021)*

Nicole St. Louis, *Research Associate, Operations and Quality Control*

Lillian Tyack, *Research Specialist, Measurement and Data Analysis*

Erin Wry, *Senior Research Specialist, PIRLS Coordinator*

Liqun Yin, *Senior Research Psychometrician*

IEA Amsterdam

Dirk Hastedt, *Executive Director*
Andrea Netten, *Director*
Paulína Koršňáková, *Senior Research and Liaison Adviser*
Roel Burgers, *Financial Director (through 2021)*
Jan-Peter Broek, *Financial Director*

Isabelle Braun-Gémin, *Senior Financial Officer*
Sandra Dohr, *Research Officer (through 2021)*
David Ebbs, *Senior Research Officer*
Philippa Elliott, *Publications Manager*
Katie Hill, *Head of Communications*
Marta Moreno Hidalgo, *Junior Research Officer*

IEA Hamburg

Juliane Hencke, *Director*
Heiko Sibberns, *Senior Research Advisor*
Oliver Neuschmidt, *Senior Research Analyst, Head of International Studies Unit*
Mark Cockle, *Research Analyst, International Data Manager - PIRLS*
Viktoria Böhm, *Research Analyst, International Data Manager - PIRLS*

Christine Busch, *Research Analyst, Team Lead QUADIS*
Elma Cela, *Research Analyst (through 2021)*
Limao Duan, *Software Developer*
Eugenio Gonzalez, *Senior Research Analyst*
Deepti Kalamadi, *Software Developer (through 2021)*
Svenja Kalmbach, *Research Analyst*
Alec Kennedy, *Senior Research Analyst*
Kamil Kowolik, *Research Analyst*
Lorelia Lerps, *Research Analyst*
Guido Martin, *Senior Research Analyst, Head of Coding Unit*
Sabine Meinck, *Senior Research Analyst, Head of Research, Analysis and Sampling*
Yagmur Rizvi, *Research Analyst (through 2020)*
Duygu Savaşçı, *Research Analyst, Sampling Unit*
Katharina Sedelmayr, *Research Analyst, Coding Unit*
Hannah Smith, *Research Analyst, Sampling Unit (through 2021)*
Xiao Sui, *Research Analyst*
Milena Taneva, *Senior Research Analyst*
Sabine Tieck, *Research Analyst, Team Lead Sampling*
Meng Xue, *Head of Software Unit*
Neha Yadav, *Software Developer (through 2020)*

Statistics Canada

Ahmed Almaskut, *Senior Methodologist*

Sylvie LaRoche, *Senior Methodologist (through 2020)*

Sampling Referee

Keith Rust, *Senior Vice President and Senior Statistical Fellow, Westat, Inc.*
