

WHAT'S NEW IN THE ASP DATA COLLECTION SYSTEM

CMS will launch a newly updated Average Sales Price (ASP) Data Collection System designed on a modern platform to enhance the data collection and ASP payment limit calculation processes. The full list of all added features and functionalities, along with other training resources, will be released with the launch of the updated system, but here are some of the key highlights and notable changes coming in April!

MODERN PLATFORM

The updated ASP Data Collection System is built on a modern platform which will allow CMS to easily add and expand system capabilities to pivot and respond to changing laws and regulations that affect Medicare Part B Drugs and payment limit calculations.

IMPROVED USER EXPERIENCE

The modernized system has clear screens, intuitive navigation, hover-over definitions, links to resources, and much more to improve the user experience!

NEW DATA TEMPLATES

The product and financial data templates for your Medicare Part B Drugs have been updated to match the data collection fields in the updated system and continue to provide an option to easily upload your data.

UPDATED DATA FIELDS

Data fields have been updated to eliminate data entry errors, standardize the data collected, and simplify the process for CMS to conduct data analysis and determine accurate calculations. Some updates include drop-down options instead of free-form text boxes when manually entering drug product data, and reorganized data fields such as two separate fields for strength and strength unit.

ONE LOCATION FOR FINANCIAL TASKS

In the modernized system, all Financial Data tasks, including restating financial data and adding data for prior quarters, are available in one location on the drop-down under the Financial Data menu.
