## ACKNOWLEDGMENT

This publication was developed by CSR, Incorporated, under Contract No. N01AA82014 for the operation of the Alcohol Epidemiologic Data System (AEDS) in August 2003, for the Division of Biometry and Epidemiology (DBE) of the National Institute on Alcohol Abuse and Alcoholism (NIAAA), National Institutes of Health (NIH). Principal authors of this manual are Thomas M. Nephew, M.P.P.S., Hsiao-ye Yi, Ph. D., Gerald D. Williams, D.Ed., Frederick S. Stinson, Ph.D., and Mary C. Dufour, M.D., M.P.H. Dr. Dufour, then Deputy Director of NIAAA and Director of DBE, was also NIAAA's AEDS Project Officer.

All material appearing in this manual is in the public domain and may be reproduced or copied without permission of NIAAA. Citation of the source is appreciated.

## FOREWORD

This Alcohol Epidemiologic Data Reference Manual (AEDRM) is part of a series of manuals that provide extensive data and other information useful to researchers, health care planners, and others interested in alcohol abuse, associated illnesses, and alcohol-related mortality. It is hoped that these documents, prepared for the National Institute on Alcohol Abuse and Alcoholism (NIAAA), will serve as a useful reference for both researchers and others interested in the alcoholism field.

This manual is the fourth edition of Volume 1 of the AEDRM series, and provides an extensive compilation of U.S. alcohol consumption data on a national, State, and regional level. The data presented in this manual are for all alcoholic beverages sold in the United States, namely beer, wine, and spirits. The data are based either on information reported directly to AEDS by individual States and the District of Columbia or on shipments data provided by the alcoholic beverage industry. For various reasons noted in the report, the data should be viewed as approximations, or estimates, of alcohol consumption.

Other volumes of the AEDRM series include information on liver cirrhosis mortality, county alcohol problem indicators, hospital discharges with alcohol-related conditions, State trends in drinking behaviors and in alcohol-related mortality, and results from the National Longitudinal Alcohol Epidemiologic Survey.

## INTRODUCTION

This Alcohol Epidemiologic Data Reference manual (AEDRM) deals with alcohol consumption as measured by State-reported sales, tax receipt data, or beverage industry data representing shipments of alcoholic beverages to a State or within a State. The present manual supersedes any previous AEDRMs on per capita alcohol consumption, including any National Institute on Alcohol Abuse and Alcoholism (NIAAA) annual surveillance report presenting data on per capita alcohol consumption prior to 2000. We hope that this information on apparent per capita alcohol consumption is of value to State alcohol authorities, planners, health care providers, and researchers interested in the alcohol field. The data should be considered only as an approximation of consumption at a national, State, or regional level.

In this manual, data reported directly to the Alcohol Epidemiologic Data System (AEDS) by alcohol beverage control boards or other State agencies are used whenever possible, because such sales data are closest to actual consumption. Beer may include both strong beer (greater than 3.2% alcohol), ale, malt liquor, and similar types of beverages, depending on State law and reporting practices. Wine may include such beverages as vermouth, champagne, sparkling wine, cider, etc., and may or may not be broken down in the State or beverage industry reports. The category of distilled spirits is the broadest of the beverage categories and includes everything from whiskey, scotch, gin, cordials, and liqueurs to premixed cocktails, again depending on legislation within each individual State.

State information is presented in (1) total volume of beverage and total volume of ethanol in thousands of gallons, and (2) per capita consumption in gallons of ethanol and in deciles based on population age 14 and older.

AEDS uses an estimate of average ethanol content to convert the gallons of sold or shipped beer, wine, and spirits into gallons of ethanol (pure alcohol). Throughout this manual, the following conversion factors have been used during the indicated years to convert volume of beverage sold or shipped to volume of ethanol:

Beer	(1850–1919)	5.0%
	(1934–2000)	4.5%
Wine	(1850–1951)	18.0%
	(1952–1968)	17.0%
	(1969–1971)	16.0%
	(1972–1976)	14.5%
	(1977–2000)	12.9%
Spirits	(1850–1971)	45.0%
	(1972–1976)	43.0%
	(1977–2000)	41.1%

Because these percentages may differ from factors published by beverage industry sources, the user of this manual should be cautious in making comparisons between data reported here and

similar types of data reported in other sources. AEDS is investigating ethanol conversion factors, based on recent publications (e.g., Kerr and Greenfield, 2003), which may be addressed in future editions. Generally, the per capita consumption estimates presented in this manual tend to be conservative because denominator data are based on persons age 14 and older and a combination of alcoholic beverage shipments data and State sales or tax receipt data are used. It is also important to note that all of the per capita estimates in this manual are based on gallons of ethanol, allowing comparisons across beverage types.

The first chapter of this manual presents national, regional, and State data on apparent per capita alcohol consumption in various tables and figures. These tables and figures are described in more detail in the beginning of Chapter 1.

The second chapter presents trend data in both tabular and graphic forms for each State and region as well as the entire nation. The table presents each beverage type, including beverage volume, ethanol volume, decile ranks, and per capita consumption and total absolute alcohol and per capita consumption. The trend in per capita consumption also is plotted on a graph for each beverage type and for all beverages. See the beginning of Chapter 2 for a further description of this table and accompanying figures.

There are two appendices in this manual; they are described as follows:

- 1) Appendix A—Additional Tables to Assist Further Research
- 2) Appendix B—Data Sources and Limitations

Appendix A presents State, regional, and national population estimates (in 1,000s) for the populations 14 years and older and 21 years and older. These population estimates are presented to make denominator data available and to assist researchers in making consumption estimates for populations 21 and older, if they desire. Per capita consumption figures for populations age 21 years and older are not presented in this manual. It is important to note that AEDS replaced 1990s population estimates used in the previous edition of this manual with reestimated population data for the 1990s that bridge the 1990 and 2000 censuses. This resulted in minor changes (mainly slight decreases) in calculated per capita consumption for the 1990s compared with figures presented in the previous edition.

Appendix B describes the limitations to consider when using the consumption data presented in this manual. These limitations range from differences in State reporting practices, to invariant national apparent ethanol contents, to time-delay factors, to the effects of tourism, business travel, and migration, and should be considered when interpreting alcohol consumption trends.

As stated earlier, AEDS makes every effort to use sales or tax receipt data obtained from individual States to calculate consumption figures. However, some States reported their sales or tax receipt data only on a fiscal year basis. State data were used only when reported on a calendar year basis. Data not available from the State sources were obtained from industry sources such as the United States Brewers Association, Inc., the Distilled Spirits Council of the United States, the Wine Institute, Jobson Publications, Inc. (Now Adams Beverage Group, Bev-Al Communications, Inc.), Steve Barsby & Associates, M. Shanken Communications, Inc., and Motto, Kryla, and Fisher, LLP.

## DEFINITIONS OF TERMS USED IN THIS MANUAL

**APPARENT CONSUMPTION**—Alcoholic beverage consumption derived from official reports of States, tax-paid withdrawal records, or reports of shipments data by the beverage industry. The word *apparent* is pertinent because the estimates are based on reports on the volume of alcoholic beverages released to the market for sale and not on reports of individuals concerning their alcohol consumption.

**DECILE**—The one of 10 groups, based on high-to-low distribution of total per capita ethanol consumption, to which a State or the District of Columbia belongs. Placement in the first decile indicates that the State ranks among the top 10 percent of States in total per capita ethanol consumption. Placement in the second decile indicates the top 20 percent, and so on.

**DRINKING-AGE POPULATION**—For purposes of this report and most previous NIAAA reports on per capita consumption, the U.S. population that is 14 years and older. Age 14 is not the legal age for drinking, but there is continuing evidence that many 14-year-olds drink alcoholic beverages (Johnston et al, 2003).

**ETHANOL**—Pure ethyl alcohol, whether from beer, wine, or spirits. This term is used synonymously with absolute alcohol.

**PER CAPITA CONSUMPTION**—The quantity, in gallons, per person for a specific population group. In this manual, per capita figures are expressed in quantity of gallons of ethanol per person 14 years and older.

**PROOF**—Standard strength or alcohol content of spirits, that relates to proof gallons on which Federal excise taxes of spirits are based. For example, 200 proof is equivalent to 100 percent ethanol; 80 proof is equivalent to 40 percent ethanol by volume, and so forth. Ethanol in beer and wine usually is reported as percent alcohol.

**REGION**—A particular group of States, as defined by the U.S. Census Bureau. The following are the regions and the States they comprise:

- Northeast—Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont;
- Midwest—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin;
- South—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia;
- West—Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

# CHAPTER 1

## NATIONAL, REGIONAL, AND STATE TREND DATA

### Introduction

This first chapter of the manual contains data tables and figures that permit the reader to make comparisons between the States or regions of the United States and the country as a whole. For the most part, coverage of the manual is limited to the years 1970 through 2000, because those years represent the most reliable source of State-reported data available to AEDS. However, there is a table that reports data from 1850 through 2000 (excluding, of course, the Prohibition Period).

This manual reports a series of consumption estimates based on a drinking age population of 14 years and older. This age is used, even though it is lower than any of the States' minimum drinking ages, because it more accurately reflects age at first drink (as reported in national surveys), and reflects access to alcohol by teenagers. The reader should note that although the per capita alcohol consumption estimates presented in this document are based on a population age 14 and older for years 1970 through 2000, population figures for persons age 21 and older also are provided (Table A-2) to permit further calculations.

The reader is urged to keep in mind the limitations of the data presented in this chapter and the second chapter of the manual (see also Appendix B). The ethanol conversion factors listed in the introduction to the manual apply to the conversion from gallons sold or shipped to gallons of ethanol in the tables and figures. A brief description of the tables and figures as they are presented follows.

Figure 1

Figure 1 presents an area graph of per capita ethanol consumption in the United States for all alcoholic beverages combined for the years 1935 through 2000.

Table 1

This table presents national-level per capita ethanol consumption data for specified drinking age populations. The data for the years 1850 through 1969 are based on a drinking age of 15 years and older, while the data for years 1970 through 2000 are based on a drinking age of 14 years and older. Different conversions to absolute alcohol were used within the beverage types prior to 1977.

A further caution is necessary in the use of Table 1. These data were generated from various beverage industry sources for the period through 1978 and therefore will vary from State-reported consumption data. The reader should not attempt to compare data presented in this table for the period from 1970 through 1978 with data for the same years in other tables in this

manual. The per capita data for ethanol for the period 1979 through 2000 will be identical to later tables because this table has been revised with the same mix of data sources used to produce those tables.

The main purpose of this table is to allow the reader to examine both long-term and short-term national trends in the consumption of beverages that comprise the three major types reported in this manual. The total per capita consumption is presented to show small but steady changes in overall drinking levels.

A major, but necessary, omission in this table is any attempt to present data for the Prohibition Period (1920–1933). Because the U.S. Constitution mandated a prohibition on the manufacture, sale, and consumption of alcoholic beverages, any consumption that did exist was illegal and therefore not recorded.

Another major issue that affects the reporting of consumption data over time is taxation. It is not within the scope of this manual to try to correlate levels of drinking to the prevailing Federal, State, and local tax rates imposed on those beverages. It is suggested that readers who wish to study the issue of taxation of alcoholic beverages contact organizations such as the Beer Institute or the Distilled Spirits Council of the United States.

Figure 2

This figure is a graphic representation of data appearing in Table 1 for the years 1970 through 2000. It depicts U.S. per capita consumption by beverage type and total consumption for the specified years.

Figure 3

Figure 3 shows the percent change in per capita beer, wine, spirits, and overall consumption for each year (1971–2000) relative to its 1970 value.

Table 2

State (including the District of Columbia), regional, and overall apparent per capita ethanol consumption data are shown for 1970 through 2000. This table presents per capita consumption separately for beer, wine, spirits, and all beverages. This table also lists the lowest and the highest per capita consumption values for beer, wine, spirits, and all beverages in each State, region, and the United States throughout this 31-year period. The actual volume of beer, wine, and spirits sold or shipped into or within each State is converted into gallons of ethanol by multiplying by the appropriate factor. These ethanol figures are then divided by the corresponding population estimates presented in Table A-1 to derive the per capita ethanol consumption figures.

#### Figures 4–5

Figure 4 includes graphic representations of State-by-State per capita consumption of beer. The top map depicts data for 1970 and the bottom depicts data for 2000. The map in Figure 5 shows percentage change between 1970 and 2000 in per capita beer consumption for each State and the District of Columbia. Together these figures show how certain States have increased or decreased in their levels of per capita beer consumption. Figures 4–11 all include the District of Columbia.

#### Figures 6–7

Statewide per capita consumption of wine for 1970 and 2000 and the percent change between these 2 years are shown in a graphic format identical to that used in Figures 4 and 5.

#### Figures 8–9

Statewide per capita consumption of spirits for 1970 and 2000 and the percent change between these 2 years are shown in a graphic format identical to that used in Figures 4 and 5.

#### Figures 10–11

Statewide per capita consumption of all alcoholic beverages for 1970 and 2000 and the percent change between these 2 years are shown in a graphic format identical to that used in Figures 4 and 5.

#### Figures 12–15

Figures 12–15 present regional trends in per capita ethanol consumption of beer, wine, spirits, and all beverages (in that order) from 1970 through 2000. One advantage in using census regions as the unit of analysis is that the per capita consumption data can be compared with other Census Bureau data and with national surveys grouped by region.

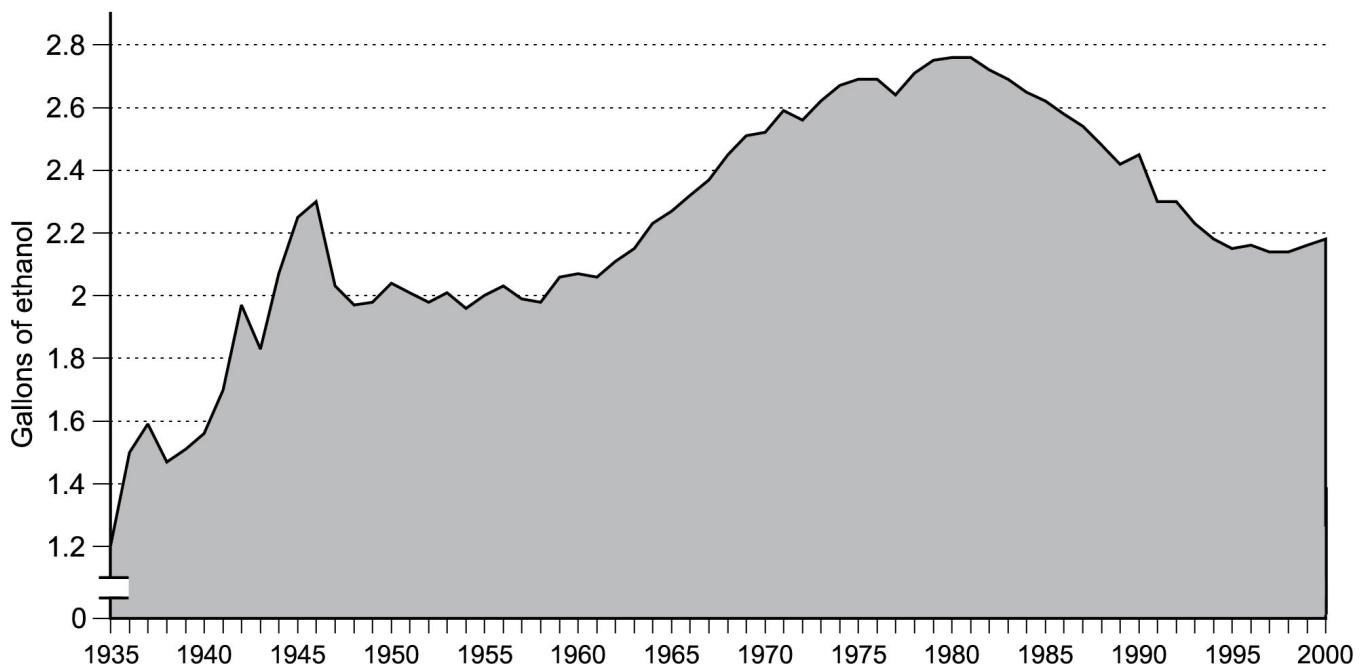

#### Table 3

This table displays volume, ethanol, and per capita consumption estimates on a statewide, regional, and national level for the 31-year period from 1970 through 2000. This table allows the reader to compare per capita consumption of beer, wine, spirits, and all beverages from year to year, both for the same geographic region and between different geographic regions.

## Summary

These tables and figures provide the reader with an overview of State and national consumption trends and patterns. Use of these data by researchers, planners, and other professionals interested in the field of alcohol abuse and alcoholism is encouraged, with the understanding that certain limitations exist (as detailed in Appendix B).

**Figure 1.** Total per capita ethanol consumption, United States, 1935–2000.

**Table 1.** Apparent per capita ethanol consumption for United States, 1850–2000.

NOTE: Volume and ethanol in 1,000s of gallons, per capita consumption in gallons of ethanol based on population age 14 years and older.

## CHAPTER 2

### STATE-LEVEL APPARENT CONSUMPTION OF ALCOHOLIC BEVERAGES

This chapter of the manual presents a table with accompanying figures that on a State-by-State basis report apparent consumption of beer, wine, spirits, and all alcoholic beverages for the period 1970 through 2000. The data are based on a drinking age population of 14 years and older.

There are a few items to be noted about the table and figures in this chapter. First of all, the table presents the years in reverse order. Also, the scale used to plot consumption may vary from figure to figure, based on the range of annual per capita consumption values for the State. The reader also should note that Table 4 ranks the States and the District of Columbia in 10 groups (deciles) based on high-to-low distributions of total per capita ethanol consumption. Placement in the first decile indicates that the State ranks among the top 10 percent of States in total per capita ethanol consumption, placement in the second decile indicates the top 20 percent, and so on.

The reader should be cautioned that this manual is intended to supersede earlier AEDS manuals and publications, and therefore some volume and per capita figures have been updated (see Table B-1 for details).

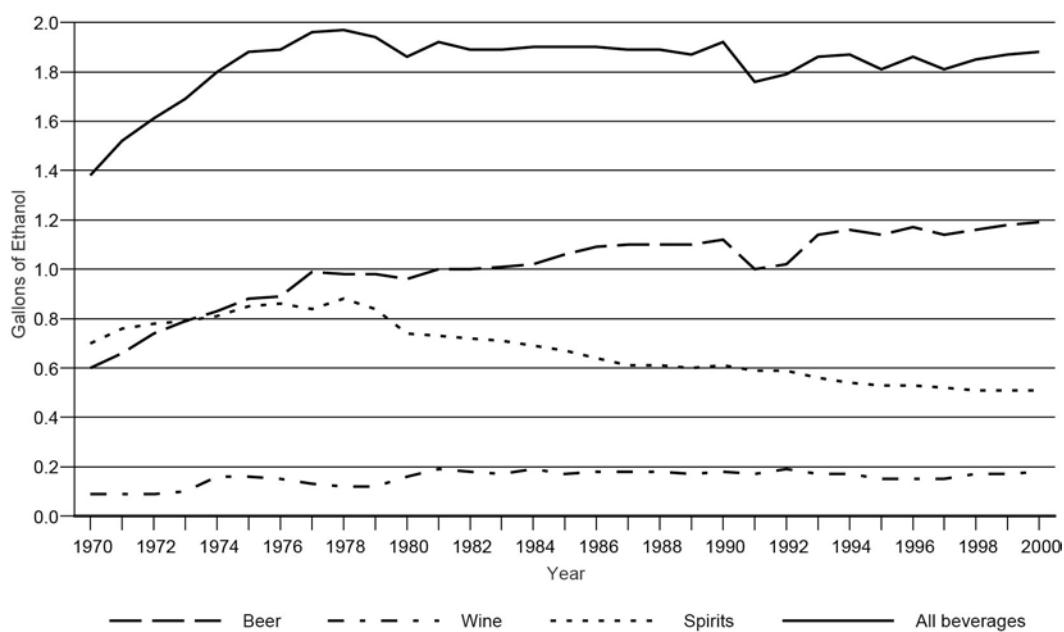

Two other cautions are necessary in using these data. First, military sales may or may not be included in the volume figures reported in each of the State tables. This is due to the following factors: (1) in some States military sales of beverages are a tax-free or reduced tax transaction, (2) State reports that reflect only excise tax collections may not include military sales at all or may not accurately represent the magnitude of such sales, and (3) beverage industry publications do not separately summarize military sales. Second, as noted in Appendix B, some data are representative of shipments rather than sales or tax collections. As shipment data may not accurately reflect whether the beverages actually were consumed during that time period, the time delay factors mentioned in Appendix B should be considered as a limitation of that type of data.

**Table 4.** Apparent per capita ethanol consumption and decile rank for individual States, census regions, and United States, by year, 1970–2000.

NOTE: Per capita consumption in gallons of ethanol based on population age 14 years and older. Decile "1" is highest.

## APPENDIX A

### TABLES TO ASSIST FURTHER RESEARCH

The following tables are provided so the reader may perform additional analyses of State or national beverage consumption. Areas covered by these tables are described below.

Table A-1

This table presents population estimates for ages 14 years and over for each of the States and the District of Columbia for the years 1970 through 2000. For many years, it has been the practice of the National Institute on Alcohol Abuse and Alcoholism (NIAAA) to regard age 14 as the minimum age in the population for which to calculate per capita consumption estimates of alcoholic beverages.

Table A-2

This table presents population estimates for ages 21 years and over for each of the States and the District of Columbia for the years 1970 through 2000. This age group reflects the current minimum legal drinking age in all States and the District of Columbia. Also, this age group traditionally has been the reference group for per capita alcohol consumption estimates presented in beverage industry publications.

**Table A-1.** Population age 14 years and older for States, census regions, and United States, 1970–2000.

NOTE: Population in 1,000s.

## APPENDIX B

### DATA SOURCES AND LIMITATIONS

#### Introduction

The data presented in this manual were derived from a number of sources. Each source—whether a State alcohol beverage control office measuring taxable, alcoholic beverages sold within their jurisdiction, or beverage industry reports of beverage shipments—computes the data reported in this and similar publications using assumptions and procedures that may be unique. Thus, differences in calculation procedures at the source level may create some inaccuracies both in magnitude of alcohol consumption for a given State and in a comparison with apparent consumption of other States.

Factors that may result in errors and underestimates of total alcohol consumption are discussed below.

#### State Reporting Practices

The data presented in these pages are based on beverage industry reports and State reports of sales, whether in terms of consumption (in various units of measure) or tax receipts (in dollars). Since the Alcohol Epidemiologic Data System (AEDS) was not in existence until the late 1970s, any previous data reported in this manual are based solely on beverage industry reports of shipments, removals from warehouses, etc., and not on State sales reports.

In reviewing various State reports, AEDS has noted differences among States in their record keeping and reporting systems. Despite efforts by AEDS to obtain routine reports from each State for beer, wine, and spirits, not all States have the resources to provide AEDS with such reports. In some cases reports for only one or two beverage types are provided. Calculations appearing in this manual are taken from State reports unless a problem of possible inconsistency is discovered. In the few cases where possible inconsistency may be present, data were taken from beverage industry shipments for those States and those years.

The levels of sales measurement may vary from State to State. In some States, beverage volumes are reported by wholesalers or producers. This can introduce temporal and geographic errors in comparisons of States due to time delays in distribution of beverages versus sales to the end user. Similarly, State taxation rates and methods of collection vary widely, so volumetric estimates based on revenue collection may not remain constant among States.

Military sales of beverages varies widely among States. It should be noted that various States provide a reduced tax liability for beverages earmarked for military sales, while others limit such sales to State wholesalers or suppliers. Because some States do not include military sales in the routine monthly reports or separate them out in beverage industry reports, military sales are not totally represented in the data reported in this manual. In cases where AEDS has full calendar year State military alcohol sales data, those data have been included in the State consumption total reported in this manual.

## Medications and Foods Containing Alcohol

Many categories of medication, including prescription and over-the-counter vitamins, tranquilizers, antacids, antihistamines, and cough preparations, include alcohol (Petroni and Cardoni, 1979; Dangor and Veltman, 1985). Certain yeast breads and soft drinks contain small (.004 to 1.662 percent by weight) amounts of ethanol, which are sufficient to affect breath-alcohol tests if a fifteen minute waiting period is not imposed (Logan and Distefano, 1998). Ethanol also is commonly used as a preservative in the food industry; however, little is apparently known about the resulting ethanol residues on foodstuffs (Barbanti, Galassi, and Potentini, 1995). The quantity of ethanol consumed via medications and foods is not included in the calculations of this manual.

## Illicit Production, Importation, and Sales

Contraband gallonage of alcohol produced or imported and consumed in the United States is not included in per capita consumption estimates. It has been speculated in the literature that there is no discernible trend in illicit production, importation, and sales (Single and Giesbrecht, 1979), but it is not known whether the production or sale of illicit or otherwise unreported alcohol is of negligible import. Illicit alcohol consumption is more significant in some areas than in others. One study (Ellis and Lacy, 1998) finds that illicit alcohol consumption among alcoholic patients declined in one such area, Tuscaloosa County, Alabama, between 1982 and 1992.

## Legal Home Production

Legal home production of wine and beer is another potentially significant source of unrecorded alcohol consumption (Single and Giesbrecht, 1979). Cider is thought to be another source of unregistered alcohol consumption in some parts of the United States. Promotions of home beer brewing kits may also influence the amount of beer consumed and its ethanol content.

## Sales, Taxes, and Transportation of Beverages Across State Lines

Estimated per capita consumption based on sales within a specific geographic area can be influenced by the effects of purchases made across State lines where prices are more favorable (Mooney, 1977). The true per capita consumption within a given State or region may be underestimated within an area because of importation of large amounts of beverages, or overestimated because of actual consumption outside of the area of purchase. For example, apparent consumption in New Hampshire and the District of Columbia may be excessively high due to purchases made by residents of neighboring States because of tax differentials and tourism (also discussed in this section of the manual). Federal tax is paid at the brewery on all beer withdrawn for sale. Because some of this beer is shipped to other States by the brewer, there is no close relationship between tax-paid withdrawals and shipments in a given State (Beer Institute, 1994, 1998). There is no known satisfactory method for determining the size of these errors.

## Consumption Not Included in State Reports

Other than the areas mentioned above, there is probably some consumption by persons employed in the alcohol industry. Other unreported alcohol intake probably occurs in areas such as skid rows, where the consumption of non-beverage alcohol may be high and certainly is unrecorded. Egbert et al (1985) suggest the prevalence of non-beverage alcohol use among V.A. hospitalized alcoholics may be as high as 15–20 percent.

### Time-Delay and other Factors Between State Taxation Records and Actual Consumption

Estimates of actual consumption may be distorted due to storage or stockpiling of alcoholic beverages on a wholesale, retail, or consumer level, which may result in a time lag before actual consumption (deLint, 1977). State regulations vary as to where alcoholic beverages, such as wine, can be sold for off-premise consumption (Jobson, 1994). In recent years, a number of microbreweries and brewpubs have emerged. Brewpubs, which began to appear in 1982, also brew for both on- and off-premise markets (Brewers Association of Canada, 1993). In addition, use of alcohol tax data may be inaccurate because there is no certainty that all the alcohol on which taxes are levied in a given time period are consumed in that period (Kling, 1989, 1991). Finally, Giesbrecht and colleagues (2000) identify a number of possible sources of accidental and intentional “slippage” between consumption of alcoholic beverages and their earlier taxation, including breakage, discarding old, stale, or unpotable beverages, and spillage.

### Inaccuracies in Calculating Ethanol from Beverage Volumes

The differences in proof within alcohol beverage categories (i.e., beer, wine, and spirits) can vary over time and by geography (due to laws or, perhaps, beverage preferences). Such differences can confound temporal and geographic comparisons.

The average proofs or ethanol conversion factors used in this manual for each of the three beverage types are national estimates. These estimates may not accurately reflect the actual proofs for each type of beverage among each of the States (Research Triangle Institute, 1978). The introduction of “light” beer, “light” wines, and coolers (both wine and spirits) may have slightly lowered the average ethanol content in some alcoholic beverages. For example, Kling (1989, 1991) suggests that there were decreases in the ethanol content of spirits during the 1980s. However, such decreases may be offset by the increase in sales of drinks with higher ethanol content, such as premium brand liquors, fortified wines, malt liquors, and locally produced beers and ales (microbrews). “Ice” beers and “dry” beers, for example, both have higher ethanol content than either premium or light beers (M. Shanken Communications, Inc. 1994). Therefore, any decrease in the average net ethanol content across all beverages has probably been minimal and not large enough to alter the trends in overall per capita consumption. While specific conversion factors are suggested for specific geographical settings (e.g., Single and Giesbrecht, 1979), few such analyses have been conducted. Recently, however, Kerr and Greenfield (2003) demonstrated that using average State beer ethanol contents for a given year, derived from (1) the market shares of beer categories (such as ice beer, imports, premium, etc.), (2) the national market shares of leading brands in each category, and (3) brand-level ethanol

contents, yielded per capita ethanol consumption estimates that are different from those produced by AEDS (Nephew et al, 2000) in terms of both time trends and cross-state rankings. Further investigation is needed to assess this alternative approach to ethanol content conversion.

#### Inaccuracies in Using Population Data in Calculating Per Capita Consumption

AEDS uses a population of 14 years and older to calculate per capita consumption rates. Although age 14 is below the minimum legal age for the purchase of alcoholic beverages in the United States, most self-report surveys indicate that many 14-year-olds drink alcoholic beverages. According to Johnston and colleagues (2003), 19.6 percent of 8th graders reported using alcohol in the past 30 days in 2002, and 6.7 percent reported being drunk in the past 30 days.

The accuracy of population data, particularly for intercensal years, is a concern. Intercensal estimates often are of decreasing accuracy as the period of time from the last full census increases. Any inaccuracies in population estimates would affect the accuracy of the per capita alcohol consumption estimates.

The Census Bureau recently has released new 5-year age group population estimates for each of the States for the years 1990 to 1999 (at <http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm>). The new numbers are improved with information gained during the year 2000 Census. However, the 5-year age cutoffs in the new release do not match our need for estimates of State populations 14 years and older. To obtain these estimates, AEDS calculated the proportion of 14 year olds in the 10-14 age group from the old population estimate for each of the years from 1990 to 1999. The proportion was then multiplied by the new estimate for the 10-14 year old population for each respective year. The resulting estimate of the number of 14 year olds was added to the number of persons 15 years and older obtained directly from the new Census release. The replacement of old population estimates for the 1990s resulted in changes (mainly slight decreases) in per capita consumption for these years compared to previous reports in this series.

Because the Census Bureau has only released Year 2000 July 1 total population estimates for each State, the number of persons 14 years and older was estimated using a similar process. The exact proportion of persons 14 years and older to the total population was calculated for each State and for the United States as a whole from the April 1 Census data. These proportions were then multiplied by the total population estimates to yield estimates of persons 14 years and older. Following a “raking” procedure used by the U.S. Census Bureau (2002), the resulting numbers for each of the 50 States and the District of Columbia were then multiplied by a constant factor so that their sum equaled the United States total value.

#### Tourism, Commuting Factors, Migration, Abstainers, and Underreporting

The effects of tourists, migrants, or transients on the population of an area or on the consumption components of any per capita estimates may be significant. For example, there are undoubtedly a large number of such persons in these categories in California, Nevada, New York, and the District of Columbia and, to an unknown extent, they may alter the per capita consumption figures for those areas by inflating the volume of alcohol consumed.

Several formulae have been proposed for correcting for tourism and migration, and one study has quantitatively measured the role of tourism in alcohol consumption (Watts and Rabow, 1981). Data needed include the number of visitors to an area, the mean duration of their stay, the number of residents of an area leaving the area, and data on consumption by visitors versus consumption by area residents traveling outside the area. However, such corrections may be unstable over time, and the measures themselves often are not measured directly, but rather are estimated from economic indices.

A large percentage of abstainers in a State's population can also significantly influence per capita consumption estimates. The percentage of abstainers varies from State to State. When reasonable estimates are available for abstainers, they can be subtracted from the denominator, thereby providing an estimate of average consumption among the drinking population (Williams, Stinson, Stewart, and Dufour, 1995). However, the prevalence of drinking may be underreported. Duffy and Waterton (1984), in a study of consumption surveys, concluded that deliberate under-reporting is a major factor operating to reduce "coverage" (the proportion of known total population consumption accounted for by survey consumption data) in alcohol consumption surveys, sometimes by at least 25 percent. Rogers and Greenfield (2000) have found that undercoverage varies from State to State, and is predicted by factors such as the proportion of Hispanics, the State's age distributions, political conservatism, and the spirits share of the ethanol market.

#### Comparison to Previous AEDS Publications

Consumption volume values reported in this data reference manual may differ from those previously published in AEDS annual surveillance reports due to updates based on data received after publication. In addition to revising data, States may provide late data allowing a full calendar year consumption volume to be calculated. In such cases, the consumption estimates derived from State data are used to replace the estimates obtained from industry sources. Less frequently, industry data sources may revise their aggregate consumption estimate for a State, beverage type, and year. These updates are listed in table B-1 below.

Per capita consumption values reported in this data reference manual also may differ slightly from those reported in earlier editions of this manual either for the same reason as above, or because better population estimates were used as denominators.

Consequently, it is suggested that this manual be used as the primary source of apparent per capita consumption for the years 1970 to 2000.

Table B-1

This table presents revisions of consumption data reported in the NIAAA Apparent Consumption Surveillance Report for 1999 (Nephew et al, 2000), which carried forward data for 1977–1998 for each State, and reflected prior Surveillance Reports for those years. Revisions occurred when new State data became available and allowed calculations to replace an industry-based value (listed under "New State Data"), or when an industry source value was revised (listed under "New Industry Data").
