RESEARCH PROGRAM

October 22, 2021

Joshua C. Denny, MD, MS  
Chief Executive Officer  
*All of Us* Research Program

 @AllofUsCEO

 National Institutes of Health

## Disclosures

Vanderbilt University Medical Center, my former employer, licensed PheWAS running within Vanderbilt's DNA biobank to Nashville Biosciences. I receive a portion of those royalty payments.

# All of Us Research Program Mission

## Nurture relationships

with **one million or more** participant partners, from all walks of life, for decades

## Catalyze a robust ecosystem

of researchers and funders hungry to use and support it

## Deliver one of the largest, richest biomedical dataset

that is secure and easy to access

# The *All of Us* Research Program: An Innovative Research Effort

- **Diversity at the scale of one million people or more**
- **Focus on participants as partners**, with return of value as a priority
- **Longitudinal design** and ability to recontact participants
- **Multiple data types**: EHR, surveys, baseline physical measurements, biospecimens, genomics, and more
- **National, open resource for all**: broadly accessible to all researchers with open-source software and tools
- **Security and privacy safeguards** for all participants

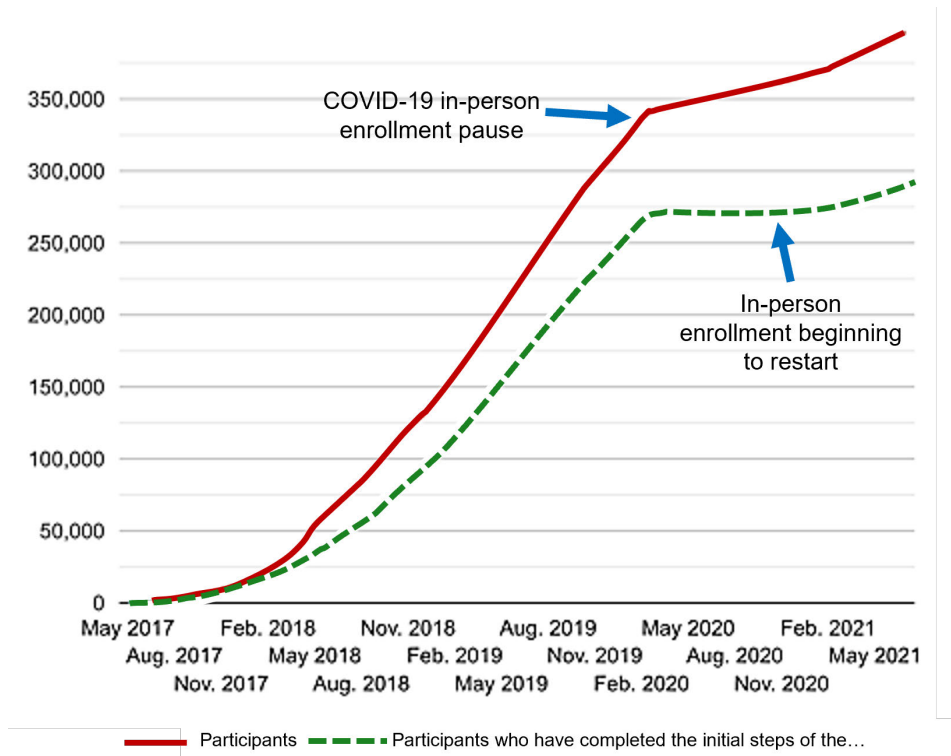

# Status of the *All of Us* Research Program (as of September 21, 2021)

**411,000+**  
Participants

**253,000+**  
Electronic Health  
Records

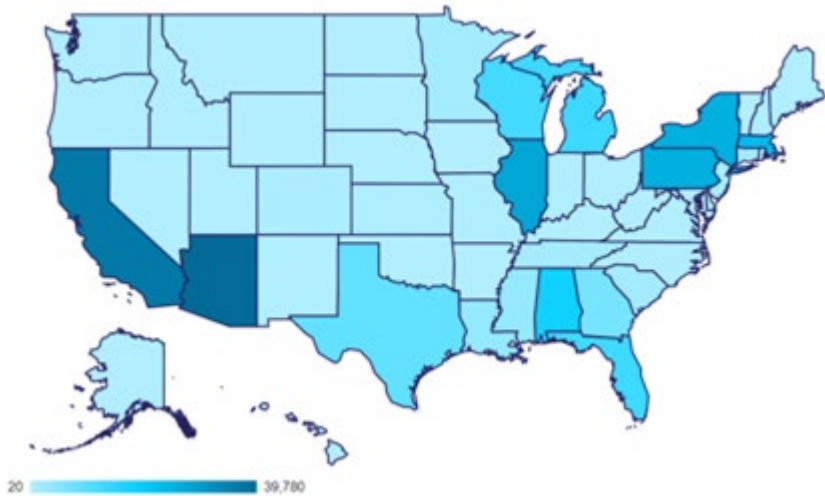

**297,000+**  
Participants who have  
completed initial steps  
of the program

**313,000+**  
Biosamples

# Status of the *All of Us* Research Program (as of September 21, 2021)

**More than 80% of *All of Us* participants are underrepresented in biomedical research**

# All of Us Research Program Core Values

## *Return of Information*

Participation is **open** to all.

Participants reflect the rich **diversity** of the U.S.

Participants are **partners**.

Trust will be earned through **transparency**.

Participants have **access** to their information.

Data will be accessed **broadly** for research purposes.

**Security and privacy** will be of highest importance.

The program will be a catalyst for **positive change** in research.

# Returning Value for Participants: Genetic Information

## Non-Health Genetic Traits

Currently Returning to  
Participants

>59,000 participants have viewed  
traits or ancestry results

## Health-Related Genetic Traits

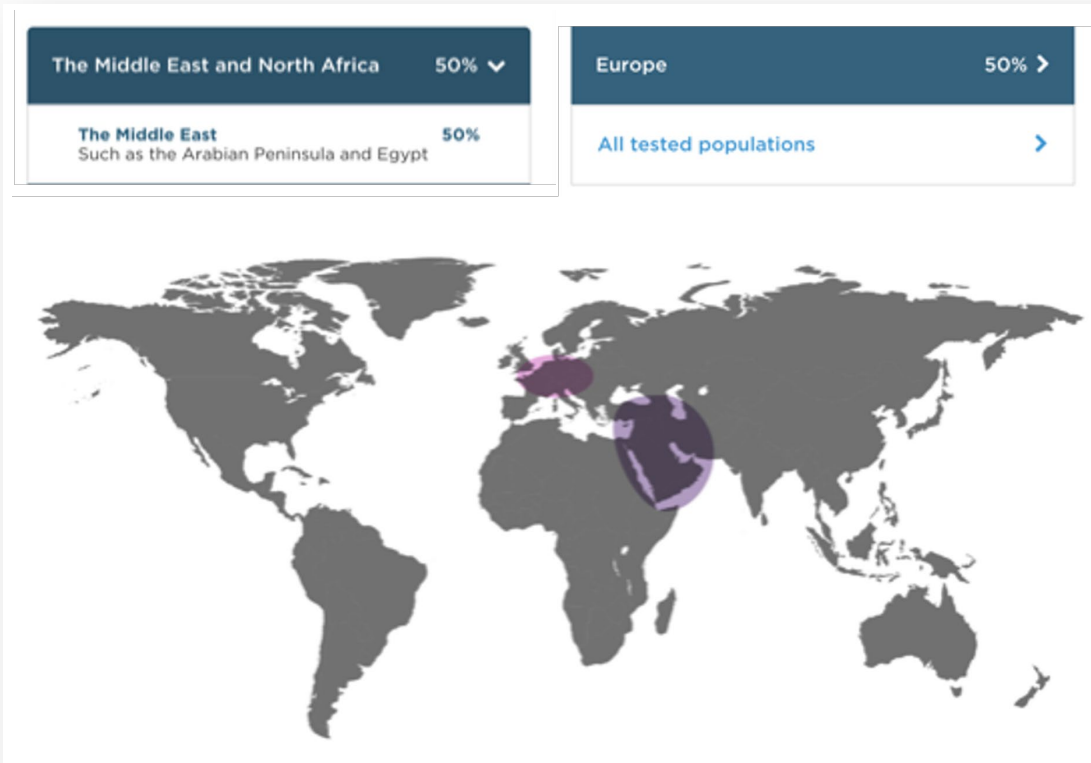

Hereditary  
Disease Risk  
(ACMG59)

Medicine and  
Your Health  
(Pharmacogenomics)

Launching in Early 2022

# Genetic Ancestry Results

## The Middle East and North Africa

This genetic group represents people from these areas:

- The Middle East
- North Africa
- Western Africa
- The Caucasus

### Connections near and far

People with recent ancestors from Asia, Europe, and sub-Saharan African may have patterns of DNA from this genetic ancestry group. This is likely because of significant trade and migration through the region that continues to this day. The Silk Road and Incense Route connected the Middle East and North Africa to Europe and Asia. Trans-Siberian trade routes connected North Africa to sub-Saharan Africa.

# Trait Results

## Ancestry

### Genetic Ancestry

Genetic ancestry can be very interesting, but you may also learn information you didn't expect. Learn more

[Get Started](#)

## Traits

### Bitter taste perception

Learn what your genes can tell you about your ability to taste bitter things.

[View](#)

### Cilantro preference

Smell and taste work together to influence your cilantro preference.

[View](#)

### Earwax type

Flaky or sticky? Earwax type is encoded in your genes.

[View](#)

### Lactose intolerance

Your genes code for lactase, which helps you digest milk.

[View](#)

## Cilantro preference

Some people like the taste of cilantro and others think it tastes like soap.

### What we looked at and why

We looked at a place in your DNA that influences if you have a slightly higher chance of liking or disliking cilantro.<sup>1</sup> The percent of people across the world who dislike cilantro ranges from 3-21%.<sup>2</sup>

- People who have slightly higher chances of liking cilantro may find it fragrant and citrusy.
- People who have slightly higher chances of disliking cilantro may find it soapy or moldy.

This place in your DNA only predicts a small amount of your chances of liking or disliking cilantro. Environmental and other genetic factors also play a role.

### Scientific details

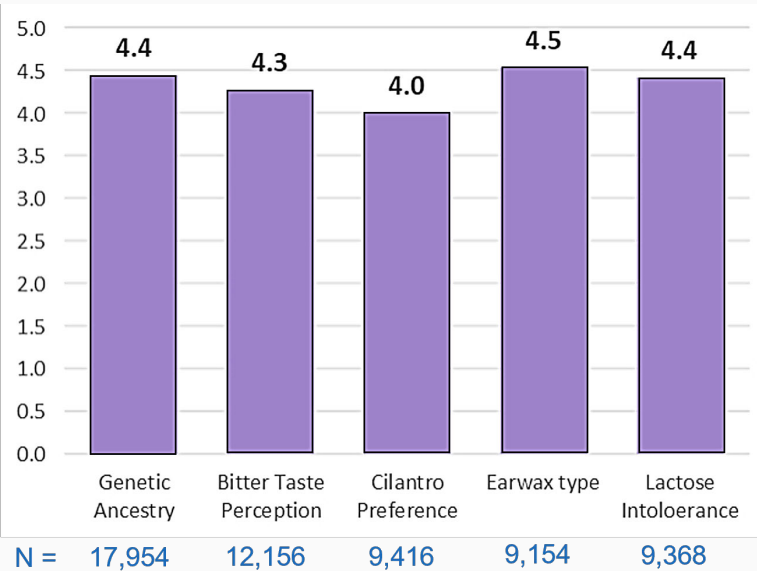

*OR6A2* makes a sensor in the nose that helps us perceive smells. Changes near *OR6A2* may impact whether you find cilantro fragrant and citrusy, or soapy or moldy.<sup>1</sup>

DNA Marker*	Gene	Your result*
rs72921001	Near <i>OR6A2</i>	C A

\* Each of your parents provides you with a nucleotide at this position, but we don't know which parent gave you which nucleotide.

# Genetic Ancestry and Traits: Preliminary Participant Satisfaction Survey Results

**How satisfied were you** with your [genetic ancestry, bitter taste perception, cilantro preference, earwax type, lactose intolerance] results?

Average Response Scale of 1–5 (Very Satisfied = 5)

Was there **anything else you were hoping to learn about** [genetic ancestry, bitter taste perception, cilantro preference, earwax type, lactose intolerance]?

## More DNA Information

- “Again, I know there is more so I'm anxiously waiting.”
- “Very interesting! I hope to learn more tendencies or traits.”
- “I welcome and look forward to any further information on my DNA.”

## Other

- “Just that I think this is totally amazing!!”
- “This whole study is interesting, and not about stuff I would have ever have thought to be significant”

# Coming in 2022: Health-Related Genetic Return of Results

Collected: September 19, 2018  
Report date: October 2, 2018

RESEARCH RESULT - Your doctor will need to confirm this result with a clinical test before using it in your care.

## Medicine and your DNA

Genes affect how we respond to medicine in many different ways.

What is this kind of information used for?

**IMPORTANT!**

Share this report with your doctor.

**Share this report with your doctor.**

**IMPORTANT!**

Share this report with your doctor.

**The BRCA1 gene**

Women and men who have this result in the BRCA1 gene have a higher chance of developing certain cancers in their lifetime compared to someone without this result. Women are at higher risk for breast cancer and ovarian cancer. They may also have a higher risk of pancreatic cancer. Men are at higher risk for male breast cancer and pancreatic cancer. They may also have a higher risk of prostate cancer.

RESEARCH RESULT - Your doctor will need to confirm this result with a clinical test before using it in your care.

**Confirm these results with a clinical DNA test.**

You are eligible for a free clinical DNA test. Because these are research results, a clinical DNA test is needed for your doctor to use this information in your care.

[Get Started](#)

### Doctors and health care providers sometimes use DNA information in a patient's care.

When deciding how often to check you for cancer or other diseases, doctors also think about other things, like your age or whether anyone else in your family had cancer or other diseases.

#### If your sex assigned at birth was female

Why does this matter?

If this result is confirmed by a clinical DNA test, your doctor might talk with you about:<sup>1</sup>

✓ Self-exams

#### If your sex assigned at birth was male

Why does this matter?

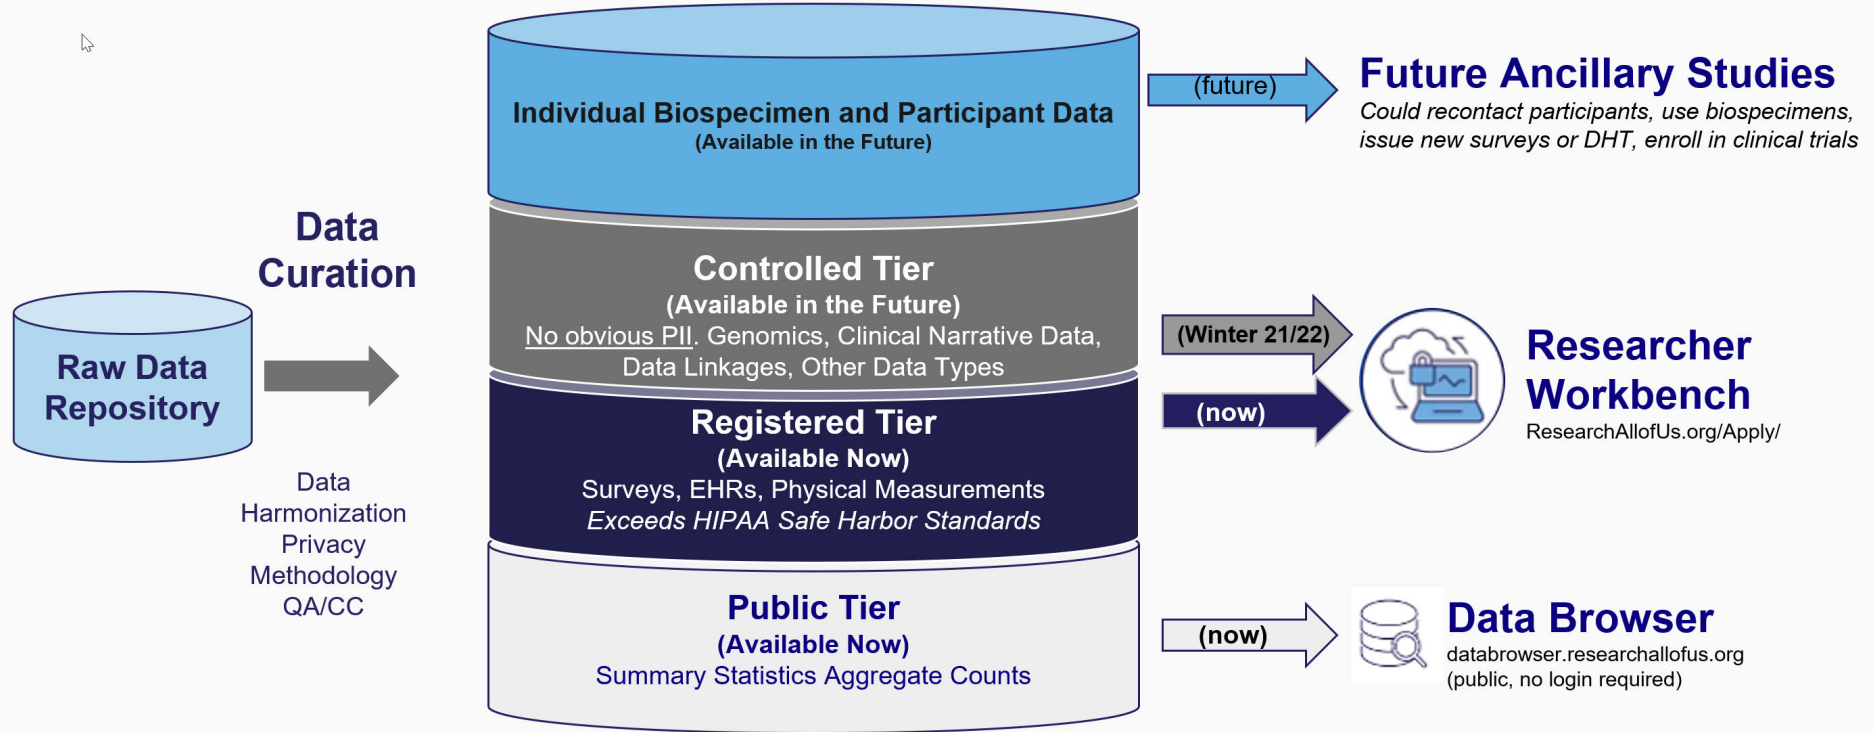

If this result is confirmed by a clinical DNA test, your doctor might talk with you about:<sup>1</sup>

✓ Self-exams

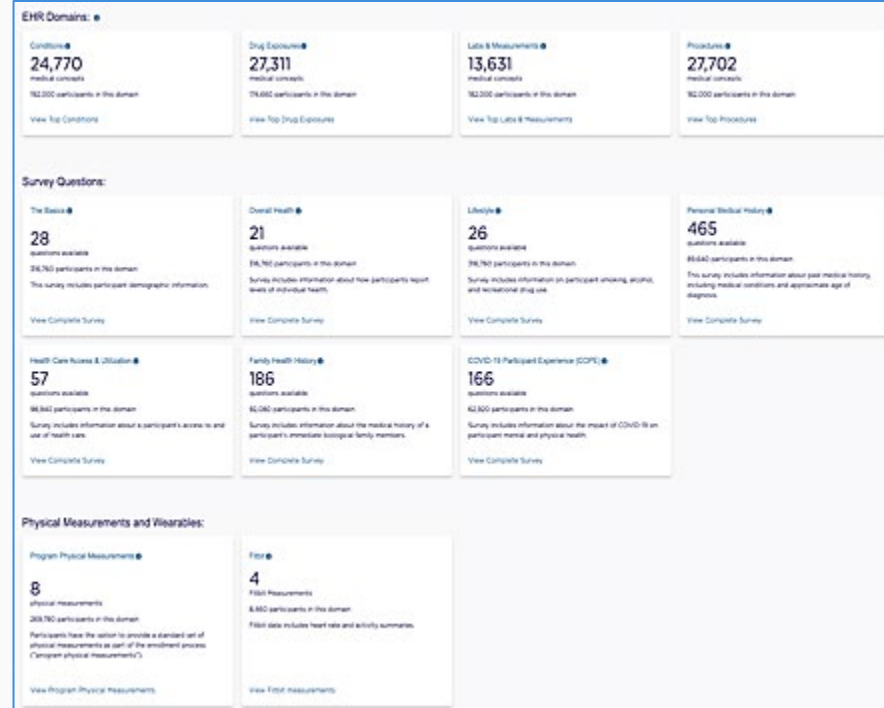

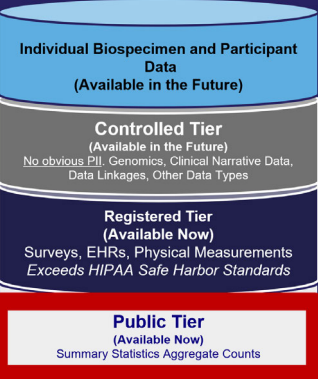

All Hereditary Disease Risk results will be returned through a genetic counselor, and we will offer confirmatory clinical genetic testing.

# Researcher Data Access

# All of Us Research Hub: Public Data Browser

## Summary statistics of participant data

- **EHR data** (conditions, drug exposures, lab and measurements, procedures)
- **Survey questions** (including COVID-19 surveys)
- **Physical measurements**
- **Open access** (no login required)

[DataBrowser.ResearchAllOfUs.org](https://DataBrowser.ResearchAllOfUs.org)

# All of Us Researcher Workbench: Access to Row-Level Data for Analysis

Individual Biospecimen and Participant  
Data  
(Available in the Future)

Controlled Tier

Summary Statistics Aggregate Counts

## Researcher Workbench Beta Launched on May 27, 2020

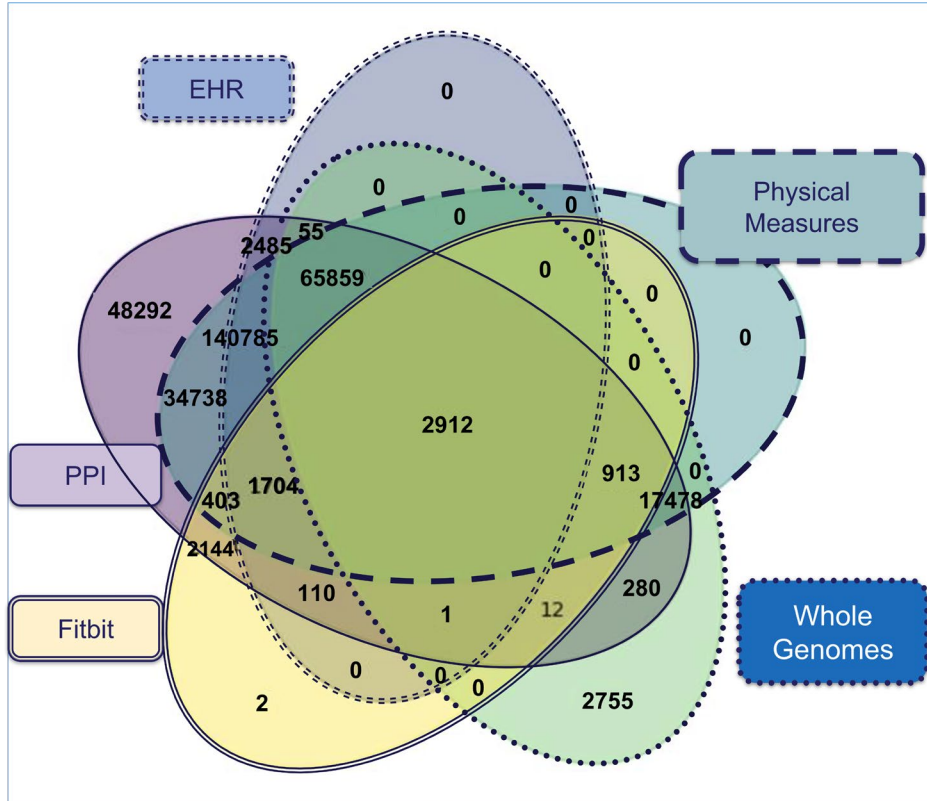

- Cloud-based central resource
- Personally identifiable information is removed
- **Passport access model**—just create, describe your workspace, and get to work! No separate IRB approval needed
- During beta phase, access requires eRA Commons ID and limited to U.S. nonprofits

The screenshot displays the All of Us Researcher Workbench interface. At the top, it says "Welcome to the RESEARCHER WORKBENCH" and "The secure platform to analyze All of Us data". Below this, there are four "Featured Workspace" cards, each with a "Create" button and a "Last Changed" timestamp. The workspaces are: "Featured Workspace: Dementia", "All of Us Survey Codebook and Frequency Distributions", "Featured Workspace: Depression", and "Featured Workspace - Type 2 Diabetes". Below the featured workspaces, there is a "Recently Accessed Items" section with six cards, each with a "View" button and a "Last Modified" timestamp. The items are: "Case 1 Notebook", "Dementia Analysis from Cohort Builder", "Ischemic Heart Disease Analysis", "Dementia Analysis", "Type 2 Diabetes Analysis", and "Ischemic Heart Disease Analysis".

# Participant EHRs and Fitbit Provide Longitudinal Data

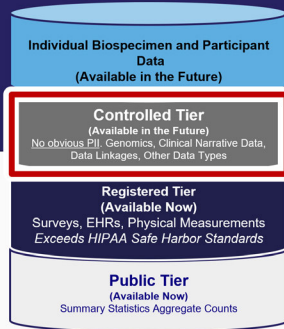

# Upcoming Controlled Tier + Genomics Data Release

## Coming Winter 2021/2022

- Expected 90,000 WGS + 120,000 arrays
- More participants
- COVID diagnoses and surveys
- More detailed demographic data
- More Fitbit data

# In Alpha Testing Now With 20K WGS Subset

Will support standard tools like PLINK and Hail

PheWAS of rs7903146 (*TCF7L2*)

The screenshot shows the All of Us Researcher Workbench interface. At the top, it says "Workspaces > [Simon's Copy] How to Work with All of Us Genomics Data > Notebooks > 03\_GWAS [Hail]". Below this are tabs for "PREVIEW (READ-ONLY)", "EDIT", and "RUN (PLAYGROUND MODE)". The main content area contains a Jupyter notebook with the following sections and code:

### Initialize Hail

As before, we first need to import Hail. We also need to import BOKAH that Hail uses for visualization.

```
In [5]: import hail as hl
from hail.plot import show
import bokah.io
from bokah.io import *
from bokah.resources import INLINE
bokah.io.output.notebook(INLINE)
%matplotlib inline
Loading BokahJS ...
```

In [6]: # Initialize Hail - set genome reference as the most recent one (e.g. GRCh38 when we created this notebook)
hl.init(default\_reference='GRCh38')
Running on Apache Spark version 2.4.7
SparkUI available at http://all-of-us-18-n.c.ou-rw-preprod-470441bb.internal:4041
Welcome to
Hail version 0.2.62-84f8a2b3d
LOGGING: writing to /home/jupyter-user/notebooks/workspaces/howtoworkwithhailtofunomicsdatafrancis/hail-20250624-19
00-8-2-62-84f8a2b3d.log

### Loading VCF data

In the following cell, we will import the VCF files that we saved in the bucket in the previous notebook.

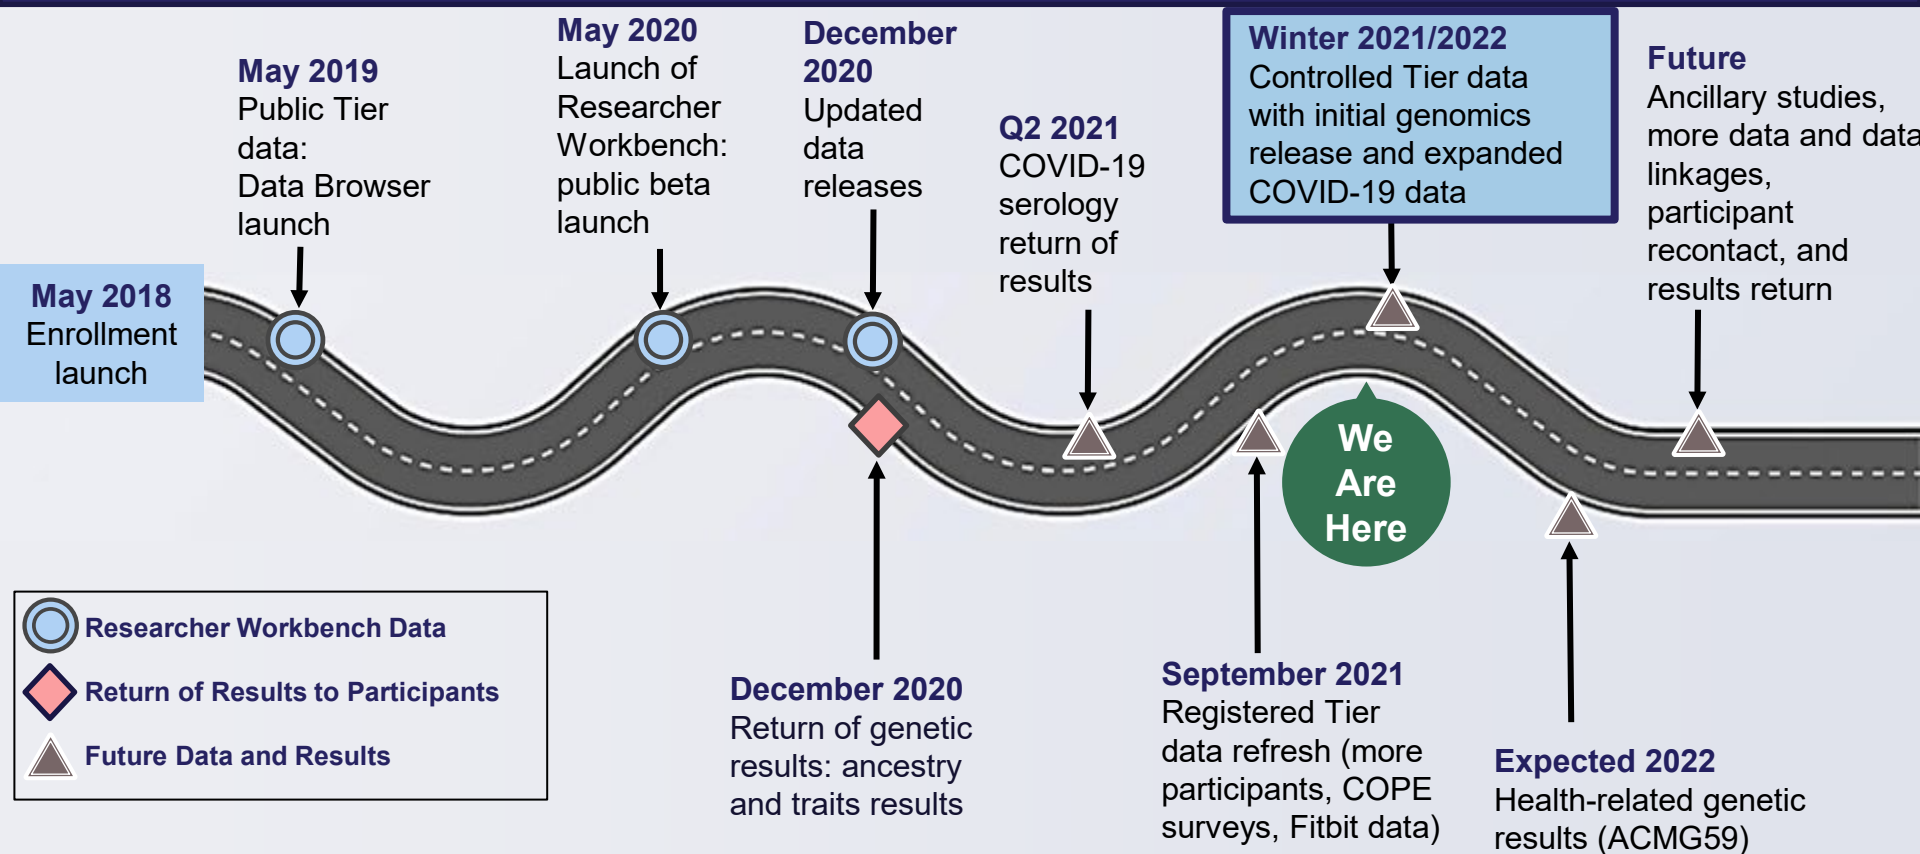

```
In [7]: mt = hl.read_matrix_table('bucket://data/cohort.vcf')
```

To reduce costs, we will only work on chromosome 2L.

```
In [8]: intervals = hl.parse_locus_intervals(reference_genome='GRCh38') for a in ['17q21.31']
mt = hl.filter_intervals(mt, intervals, keep=True)
```

@UK\_Biobank

# Disclosure Slide

Financial Disclosure for  
Naomi Allen, MD, PhD

I have nothing to disclose

## UK Biobank: 2021 and Beyond

- Enabling scientific discoveries that improve human health
- Further increasing the breadth and depth of participant characterisation
- Democratising access to the UK Biobank resource

UK Biobank has a **unique** combination of:

- Large-scale data
  - 500,000 participants
  - 40–69 years
  - Recruited 2006–2010
- Deep characterization (lifestyle, physical measures, etc.)
- Data highly standardized and curated
- Biological samples (blood, urine, saliva)
- Linkage to electronic health records over time (now has 10 years of follow-up)
  
- **Readily accessible to researchers worldwide**

- Custom-built genome-wide array (850,000 variants) with imputation to 90,000,000+ variants; released in 2017
- These data are transforming population-based genetic research
  - GWAS of thousands of traits now publicly available (e.g., Stanford, Broad, Edinburgh)
  - Made possible through:
    - Large size
    - Standardized measurement
    - Linkage to health records over time

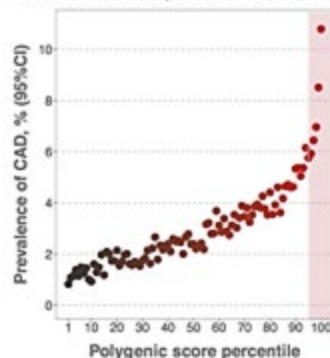

## Creation of polygenic risk scores

E.g., PRS for heart disease:

- Risk in top 5% equivalent to many monogenic disorders
  - Independent of known risk factors
  - Modifiable by lifestyle and/or medication
  - Clinical utility to be established
- 
- Much we still don't understand about genetic variation (in coding and noncoding regions) on health

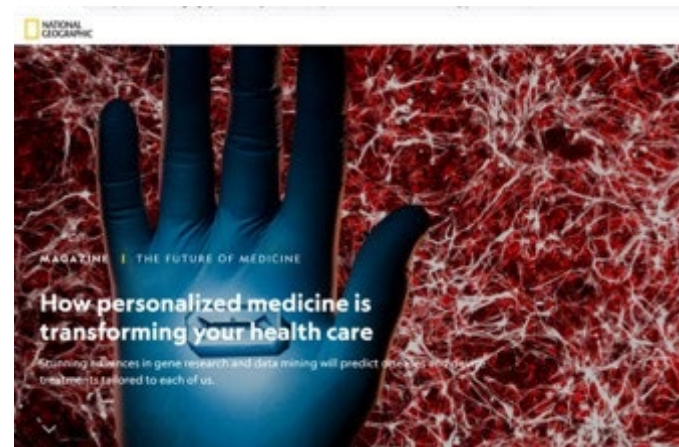

Results: polygenic score in the general population  
 UK Biobank: N=288,890

Prevalent coronary disease: N = 8,676

High polygenic score definition	Odds ratio
Top 5%	3.3
Top 2.5%	4.0
Top 1%	4.7
Top 0.25%	6.3

Khera et al., *Nat Genet.* 2018;50:1219–1224.

- Coding regions (~2% of genome)
- Regeneron-led commercial funding
- Timeline of data availability:
  - 50,000 in March 2019
  - 200,000 in Oct. 2020
  - 300,000 in Sept. 2021
  - **Full cohort end: Oct. 2021**

*“This precompetitive collaboration has further strengthened the ties between academia and industry and provided teams an unprecedented opportunity to interact with and learn from the wider research community.”*

**Janssen**  
**GSK**

The screenshot shows a news article from UK Research and Innovation. The headline is "World-leading genomics project to give insights into health and disease". The article text includes: "In a major advance for public health and for the UK's global leadership in genomics, a £200m+ project has been announced today. This public-private collaboration will support the complete sequencing of the genomes of 500,000 people...". It also mentions funding from the government's research and innovation age challenge fund, £50m from Wellcome, and a further £100m from AstraZeneca. A quote from Sara Marshall, Head of Clinical and Physiological Sciences at Wellcome, is included: "The generosity of 500,000 healthy volunteers could help us all". The article concludes that the project will create a unique resource to help researchers unlock new treatments and preventative measures for a wide range of diseases.

The graphic features the headline "The generosity of 500,000 healthy volunteers could help us all" in a large, bold font. Below the headline is a small portrait of Sara Marshall, identified as the Head of Clinical and Physiological Sciences at Wellcome. The main body of text describes the project: "UK Biobank's project to sequence the genomes of 500,000 participants creates a unique resource that will help researchers to unlock new treatments and preventative measures for a wide range of diseases." At the bottom of the graphic is a photograph of a server room with rows of blue server racks.

- Telomere length in all 500,000
  - Data available March 2021
- NMR-metabolomics in all 500,000
  - Data available for 120,000 March 2021
- Proteomics in 57,000 samples (initially)
  - Olink platform (3,000 proteins)
  - Data available 2022

University of Leicester

Janssen

Novo Nordisk

Pfizer

Regeneron

Takeda

• Cohort-wide assays more flexible than case-control comparisons

- Largest study in the world (by far) to undertake population-based multimodal imaging
  - MRI—brain, heart, body
  - Carotid ultrasound—measures of large artery
  - DXA—low-dose x-ray of bones and joints
  - 12-lead ECG
  - Cardiac monitor (subset)
- 50,000 of 100,000 participants imaged
- Repeat imaging of up to 70,000 participants to enable assessment of longitudinal change in imaging phenotypes
- Enables research into disease pathways and early detection

- Background: Emerging data suggests that multi-organ injury with SARS-CoV-2 infection is common and associated with medium- to long-term consequences
- Aim: to generate unique data to assess effect of SARS-CoV-2 on changes in internal organs by performing imaging scans on individuals before and after infection
- 50,000 participants imaged before the pandemic received a home-based SARS-CoV-2 antibody lateral flow test
- Invited 2,000 individuals (half seropositive, half seronegative) for a second imaging assessment
- Only study in the world with both pre- and post-infection imaging data

## Existing linkages

- Death registry
- Cancer registry
- Hospital admissions
- Primary care (latest data COVID-19 research only)
- SARS-CoV-2 PCR tests

**More than 200  
publications related  
to COVID-19 research**

## Potential future linkages

- Microbiology
- Clinical disease audits
- Mental health services
- Ophthalmic records

**New approaches needed to combine data across diverse health records to characterize health outcomes that are:**

- Valid
- Comprehensive
- Scalable

MORE THAN 27,000 APPROVED RESEARCHERS IN 70+ COUNTRIES

## 2012

## 2020

**UK**

**International**

**UK**

**International**

## Today

- A lending library
- Researchers download data, perform research, publish results, return derived data, delete data

*Data moves to the compute power*

## Tomorrow

**DNA nexus  
Amazon Web Services**

- Also a reading library
- Researchers access the data in situ, perform analysis, publish results, generate derived data

*Compute power moves to the data*

- Democratization of access
- Flexible, scalable, secure
- Launched Sept. 28, 2021

# The IHCC Experience Bringing Cohort Data Together to Advance Precision Health Around the Globe

Laura Lyman Rodriguez, PhD  
IHCC Steering Committee

International 100K Cohort Consortium

# Disclosure Slide

Financial Disclosure for  
Laura Lyman Rodriguez, PhD

I have nothing to disclose

# Disclaimer

All statements, opinions, or discussions are solely representative of my personal views and are not reflective of any positions of the Patient-Centered Outcomes Research Institute (PCORI)

# Premise for Consortium

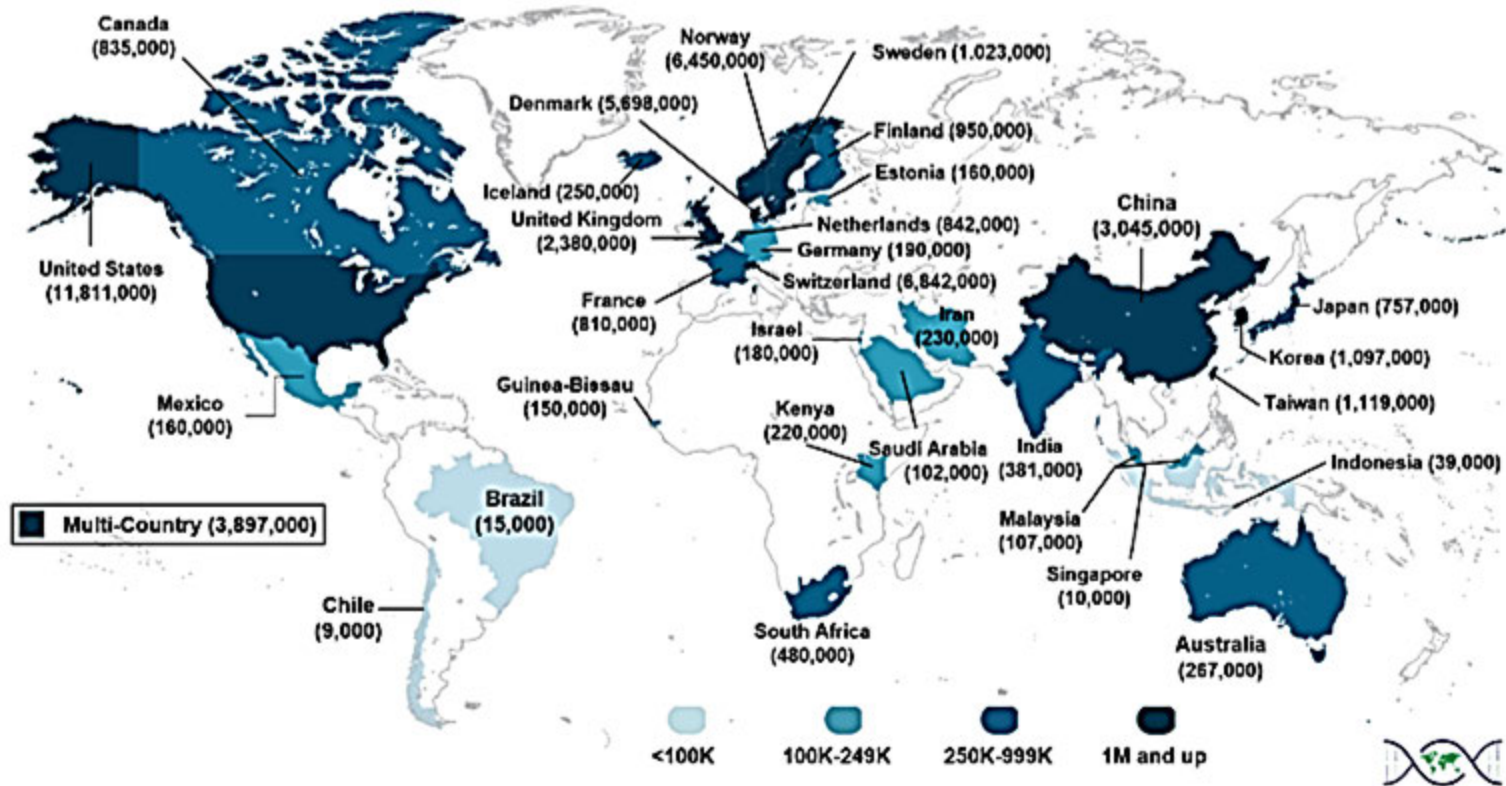

## International 100K+ Cohorts Consortium (IHCC)

- Large cohort studies have been established worldwide (some for decades)
- Each constrained by size, ancestral origins, and geographic boundaries
- Constraints limit analyses (e.g., subgroup, exposures, interactions)
- Combining data from these cohorts enables addressing pressing global health questions none can answer alone
  - Enhance value of each
  - Leverage enormous investments in them

# Power and Potential of IHCC for Research

## IHCC Member Cohorts across the World

~110 cohorts, ~60M participants

# What Does IHCC Intend to Add to the Community?

## Vision

A global community of cohorts working together to advance science and improve health for all.

## Mission

To forge cohort connections that revolutionize population health science by providing sustainable data infrastructure, cultivating a collaborative research environment, and promoting policies and best practices that foster connectivity, interoperability, and reciprocity.

# Foundational Elements: Defining the Basics

## — Building the Framework

### *Guiding Principles:*

Promotion of inclusivity of cohorts within IHCC activities (focus on LMIC)

Open and timely dissemination of research findings

Transparency about IHCC activities

- Scientific Project Proposal Process
- Publication Policy
- Guidance for Collaboration with Industry
- Core Data Sharing Principles

# IHCC: Core Values

## Action-Oriented, Inclusive and Equity-Focused, Audacious Intentions

We are INTENTIONAL	We focus on building the systems, structures, policies, and practices that enable and sustain cohort collaboration. We do great science rather than just talking about it. We communicate and disseminate our work widely.
We have INTEGRITY	We value transparency, honesty, fairness, and respect. We approach our research with absolute integrity as the basis for the trust imperative to our collective and collaborative endeavors.
We embrace DIVERSITY	We strive to be truly global and inclusive. Any qualifying cohort that wants to be part of our community is welcome. We believe that all cohorts have something to gain and something to contribute and that reciprocity in learning is key to our success.
We strive for EQUITY	We create a supportive environment in which all cohorts and colleagues will excel. We enhance the capacity of each cohort and across cohorts. We see all cohorts as equal in terms of stature and opportunities to contribute.
We act with AUDACITY	We take moonshots and tackle difficult challenges to make progress. We encourage innovation in the discovery and translation of breakthroughs.

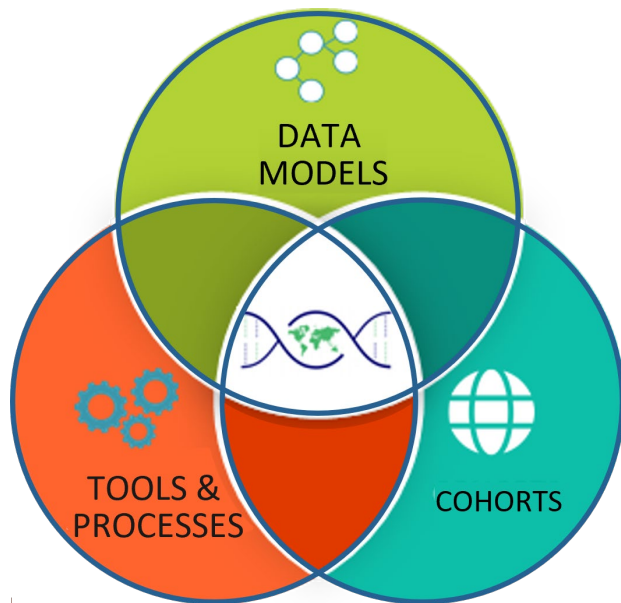

## Thomas Keane (UK) & Philip Awadalla (Canada), Co-Leads

- IHCC brings together several axes of cohort data (e.g., disease status, data use, sample collection parameters, genotype, phenotype)
- IHCC consists of a highly diverse set of more than 100 cohort data dictionaries
- IHCC Cohort Atlas aims to:
  - Survey and collate cohort data dictionaries for all IHCC cohorts
  - Semantically harmonize the cohort metadata
  - Develop an online cohort atlas to enable discovery across IHCC cohorts

## Building a Common Framework

1. Data models to represent both access conditions and cohort data
2. Tools and processes for implementations
3. Deployment over clinical cohorts

Slides adapted from C. Yung

<https://ihccglobal.org/2021-virtual-summit/>

# IHCC Cohort Atlas Project

- 13 cohorts searchable; >100 variables
- Atlas pipeline applied to second IHCC Project
- Workshops to learn more about the atlas to be held this fall

Cohort presentation and display

Reference to external cohort sites

The screenshot shows the IHCC Cohort Atlas interface. On the left is a filter panel with categories: Cohort Name, Countries, Biospecimens, Environmental Data, Genomic Data, Phenotypic/Clinical Data, Basic Cohort Attributes, and Sample Types. The main area features a 'Cohorts by Country' bar chart, a 'Biosample Types' network diagram, and a table of cohorts. A table with 10 columns (Cohort Name, Countries, Current Enrollment, Genomic Data, Environmental Data, Biospecimen Data, Clinical Data, Data Sharing Potential, PI Lead, Website) lists various cohorts like 23andMe, Africa Health Research Institute, and BioVU Vanderbilt.

# IHCC Funded Projects: August 2021

Project	PI/PM	Institution	Funders	Year	# cohorts	# LMIC cohorts
Polygenic Risk Scores (PRS)	Hákon Hákonarson (USA)	Children's Hospital of Philadelphia (CHOP)	NIH/WT	2020	6	2
Exploring the Role of Genetically Determined BMI in Infancy, Childhood, and Early Adulthood on Colorectal Cancer Development in Later Life	David J. Hughes (Ireland)	University College Dublin, International Agency for Research on Cancer (IARC), University of Texas	NIH/WT	2021	4	1
High-Throughput Metabolomic Biomarker Measures in Diverse Ancestries	Hákon Hákonarson (USA)	CHOP	NIH/WT	2021	4	2
Opioid Cohort Consortium (OPICO) to Investigate the Effects of Regular Opioid Use on Mortality and on Cancer Development	Paul Brennan (France)	IARC	NIH/WT	2021	10	4
Global Mental Health Impact of the COVID-19 Pandemic	Jordan Smoller (USA) Sarah Bauermeister (UK) & Andre Brunoni (Brazil)	Massachusetts General Hospital, Oxford University, University of Sao Paulo Medical School	NIH/WT	2021	12	3
Novel Coronavirus Host Susceptibility Study in South Africa (COVIGen-SA)	Michele Ramsay (South Africa)	Wits Health Consortium	NIH/WT	2021	3	3
Strengthening Biospecimen Collection for Global Longitudinal Population Studies in the COVID-19 Era	John Chambers (Singapore)	Nanyang Technological University	CZI	2021	4	3
Davos Alzheimer's Collaborative: Pilot PRS	Davos Alzheimer's Collaborative: Pilot	CHOP	DAC	2021	7	4

# Polygenic Risk Score Implementation Pilot

## ■ Hákon Hákonarson (USA), PI

- Late 2019: NIH funded IHCC to conduct a cross-network pilot
  - A proof-of-principle to demonstrate feasibility across a condensed timeline (4 months)
- All IHCC cohorts invited to participate
  - Federated model, whereby sites generate PRSs locally and share summary statistics for centralized analyses
- 2 common traits (BMI, BP) and 2 complex diseases (T2D, asthma)
  - Present across the global population
  - Requirement that each trait had recent large scale meta-analysis reported with **publicly available** genome-wide summary stats
- Scientific goal
  - Compare trans-ancestry and ancestry specific PRS scores in different populations

# Polygenic Risk Score Implementation Pilot

Cohort Name	PI: Lead	Participating Countries	Current Enrollment
ELSA-Brasil	Paulo A. Lotufo	Brazil: six cities	15,105
Norwegian Mother and Child Cohort Study (MoBa)	Per Magnus	Norway	284,000
Children's Hospital of Philadelphia (CHOP) Biorepository	Hákon Hákonarson	USA, Europe, South America, Canada, Saudi Arabia, and Australia	500,000
NHS (Nurses' Health Study, NCI)	Meir Stampfer, Rulla Tamimi	USA	121,700
NHSII (Nurses' Health Study II, NCI)	Walter Willett, Heather Eliassen	USA	116,430
Shanghai Men and Women's Health Study (2 cohorts)	Wei Zheng	Shanghai, China	136,000
UK Blood Donor Cohorts	Emanuele Di Angelantonio, John Danesh	UK	100,000

## Interested but could not participate

23andMe	Joyce Tung	USA	6,800,000
East London Genes and Health	David van Heel	UK	41,500
Estonian Genome Project	Andres Metspalu	Estonia	200,000

# Polygenic Risk Score Implementation Pilot

## Results/Conclusions

- Trans-ancestry scores outperform population specific scores in non-European cohorts with similar predictive values
- A modular approach of generating scores at one site and applying across the consortium, while it has issues, does appear to work well
- Additional population-specific LD files, such as South Asians, may be beneficial
- For some phenotypes, such as BP and asthma, summary stats are not yet sufficiently good to generate predictive PRS
- Data sharing agreements between the participating cohorts would greatly facilitate work; by sharing individual-level genotypes, we can generate common weights across the participant sites

# Metabolomic Markers in Diverse Ancestries

**A. Butterworth (UK), A. Brunoni (Brazil), A. Etemadi (US),  
H. Hákonarson (US)**

- Chronic diseases impose a high burden on the health system.
- Health outcomes can be significantly improved through early diagnosis and intervention.
- Early diagnosis often unavailable particularly for individuals in low- and middle-income countries and minority populations in high-income countries.
- Metabolic profiling represents a highly-scalable model for risk prediction and prevention.

Slides adapted from A. Etemadi  
<https://ihccglobal.org/2021-virtual-summit/>

# Metabolomic Markers in Diverse Ancestries

## Participating Cohorts

Cohort Name	Study Samples	Principal Investigator/Lead(s)
South Asian Cohorts (BELIEVE)	1,500 samples of South Asian ancestry from Dhaka, Bangladesh	Adam Butterworth
ELSA-Brasil	1,000 samples from Brazilian civil servants	Andre Brunoni
Golestan Cohort Study	1,000 samples from Northeast Iranian general population	Arash Etemadi
Children's Hospital of Philadelphia (CHOP)	1,500 samples of African American children	Hákon Hákonarson

- Project developed with intention of scaling up beyond initial pilot studies
- Each study has own cohort-specific outcomes
- Data from samples recently received; analysis underway

## Overarching IHCC Goals: 2–3 Years

- **Demonstrate That IHCC Generates Impactful Science**
  - Provide proof of concept that IHCC generates impactful science through ambitious scientific projects that require scale and diversity and improve health for all
- **Enable Discovery and Connectivity of Cohorts for Collaboration**
  - Facilitate cohort discoverability and data access by enhancing IHCC's Atlas
- **Make It Possible for All Cohorts to Contribute to IHCC Scientific Challenges**
  - Promote development and/or adoption of policies and best practices and enhance cohort capabilities and competencies to improve the practice of collaboration
- **Build a Strong Governance and Operational Foundation**

# GA4GH Standards to Enable Global Access and Interoperability of Data to Inform Precision Health

*Heidi Rehm, PhD*

*Massachusetts General Hospital and Broad Institute of MIT and Harvard  
Boston, MA, USA*

# Disclosures for Heidi Rehm

I receive NIH funding to support GA4GH (U24HG011025)

Why do we need the  
**Global Alliance for Genomics and Health,**  
and what does it do?

# Challenges

- Data is typically in silos:
  - By type, by disease, by country, by institution
- Analysis methods are non-standardized; few work at scale
- Different approaches to regulation, consent, and data sharing limit interoperability

## **Why data sharing is needed:**

- Increases statistical significance of analyses
- Builds evidence for gene–disease causality by gathering rare disease patients
- Leads to “stronger” variant interpretations by aggregating evidence
- Supports more informed clinical decisions

These challenges and opportunities led to the launch of GA4GH in 2013

## The GA4GH Mission

**The Global Alliance for Genomics and Health** aims to accelerate progress in genomic science and human health by developing standards and framing policies for responsible genomic and health-related data sharing.

# About GA4GH

## GA4GH aims to...

Enable **international** data sharing

Promote sharing across the **translational continuum** (research, clinical, industry)

Encourage technology-enabled **federated approaches** (bring analysis to the data) where needed to access data

Promote **interoperability** (scientific, technical, ethical)

## GA4GH achieves this by...

- **Convening** stakeholders
- **Catalyzing** sharing of data
- **Creating** harmonized approaches
- **Acting** as a clearinghouse
- **Fostering** innovation
- **Committing** to responsible data sharing
- But **not** generating data or performing research/care for patients

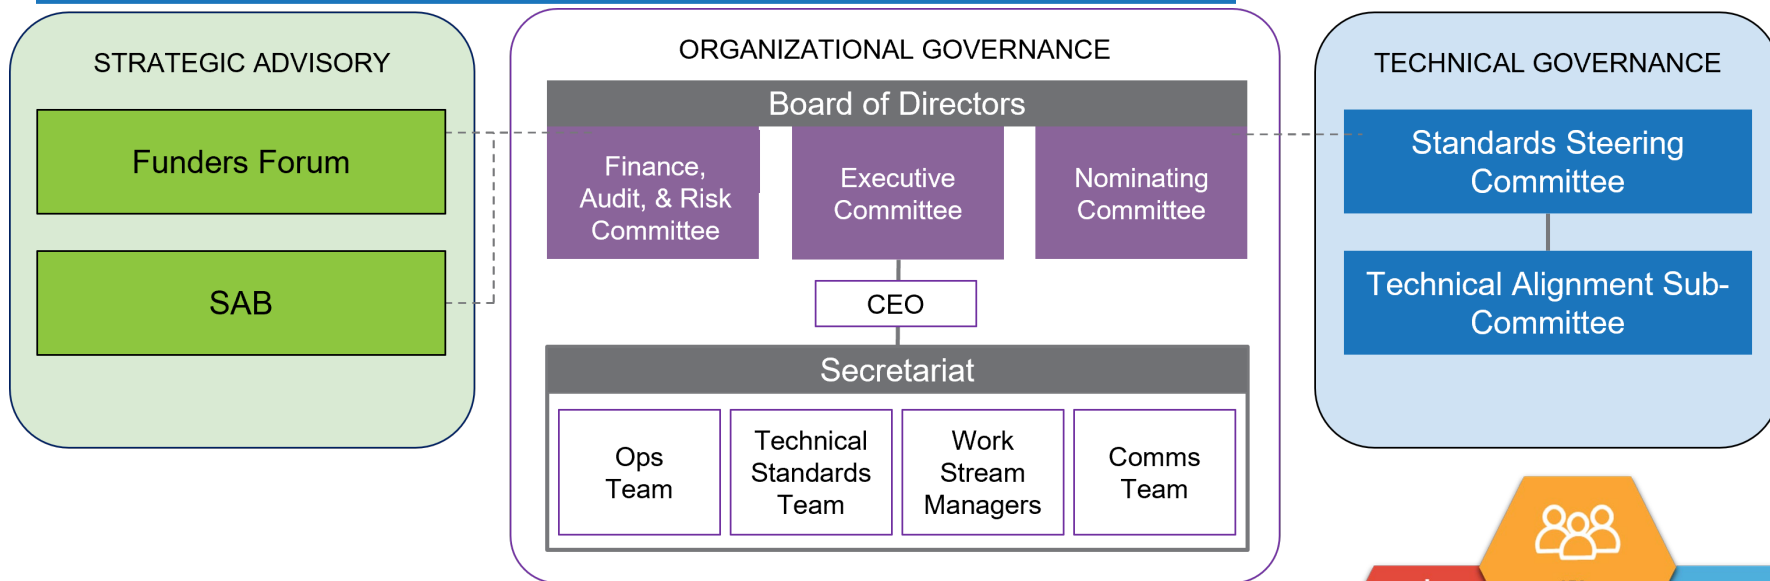

# Core Framework for Responsible Sharing of Genomic and Health-Related Data

Built on **Universal Declaration of Human Rights (1948, 27(1): “The Right to Science”)**:  
“Everyone has the right...to share in scientific advancement and its benefits.”

The screenshot shows the homepage of the Framework for Responsible Sharing of Genomic and Health-Related Data. At the top, there is a blue header with a scale of justice icon and the title "Framework for Responsible Sharing of Genomic and Health-Related Data". Below the title, it says "Last Updated: 9 DECEMBER 2014". The main content area is divided into two columns. The left column contains a "Table of Contents" with links to Preamble, Purpose and Interpretation, Application, Foundational Principles, Core Elements for Responsible Data Sharing, Implementation, Mechanisms and Amendments, Acknowledgements, and Appendix 1. Below the table of contents are sections for "CONTRIBUTORS", "Downloads" (with a "DOWNLOAD PDF" button), and "Download in other languages" (listing Arabic, Chinese, French, German, Greek, Hindi, Italian, and Japanese). The right column features a "Preamble" section with the text: "The sharing of genomic and health-related data for biomedical research is of key importance in ensuring continued progress in our understanding of human health and wellbeing. The challenges raised by international, collaborative research require a principled but nevertheless practical Framework that brings together regulators, funders, patient groups, information technologists, industry, publishers, and research consortia to share principles about data exchange. Such a Framework will facilitate responsible research conduct." It also includes a paragraph about the framework's development under the auspices of the Global Alliance for Genomics and Health and a paragraph about the guidance it provides for the responsible sharing of human genomic and health-related data, including personal health data and other types of data that may have predictive power in relation to health. It highlights Article 27 of the 1948 Universal Declaration of Human Rights and mentions that many other international conventions and national laws, regulations, codes and policies also guide responsible data sharing behavior. Finally, it states that the framework is guided by the human rights of privacy, non-discrimination and procedural fairness, and that it considers all human rights principles relevant, complementary and interrelated, founded as they are on respect for human dignity. Since science proceeds only with the broad support of society, respect for all persons is a primary driver underlying all other derived principles. In particular, this Framework establishes a set of foundational principles for responsible

## Findable

- Beacon API
- Data Use Ontology
- refget API
- Search API
- Service Registry Prototype
- Tool Registry Service (TRS)

## Accessible

- Authentication & Authorization Infrastructure
- Data Repository Service
- Data Use Ontology
- Researcher ID & Bona Fide Status

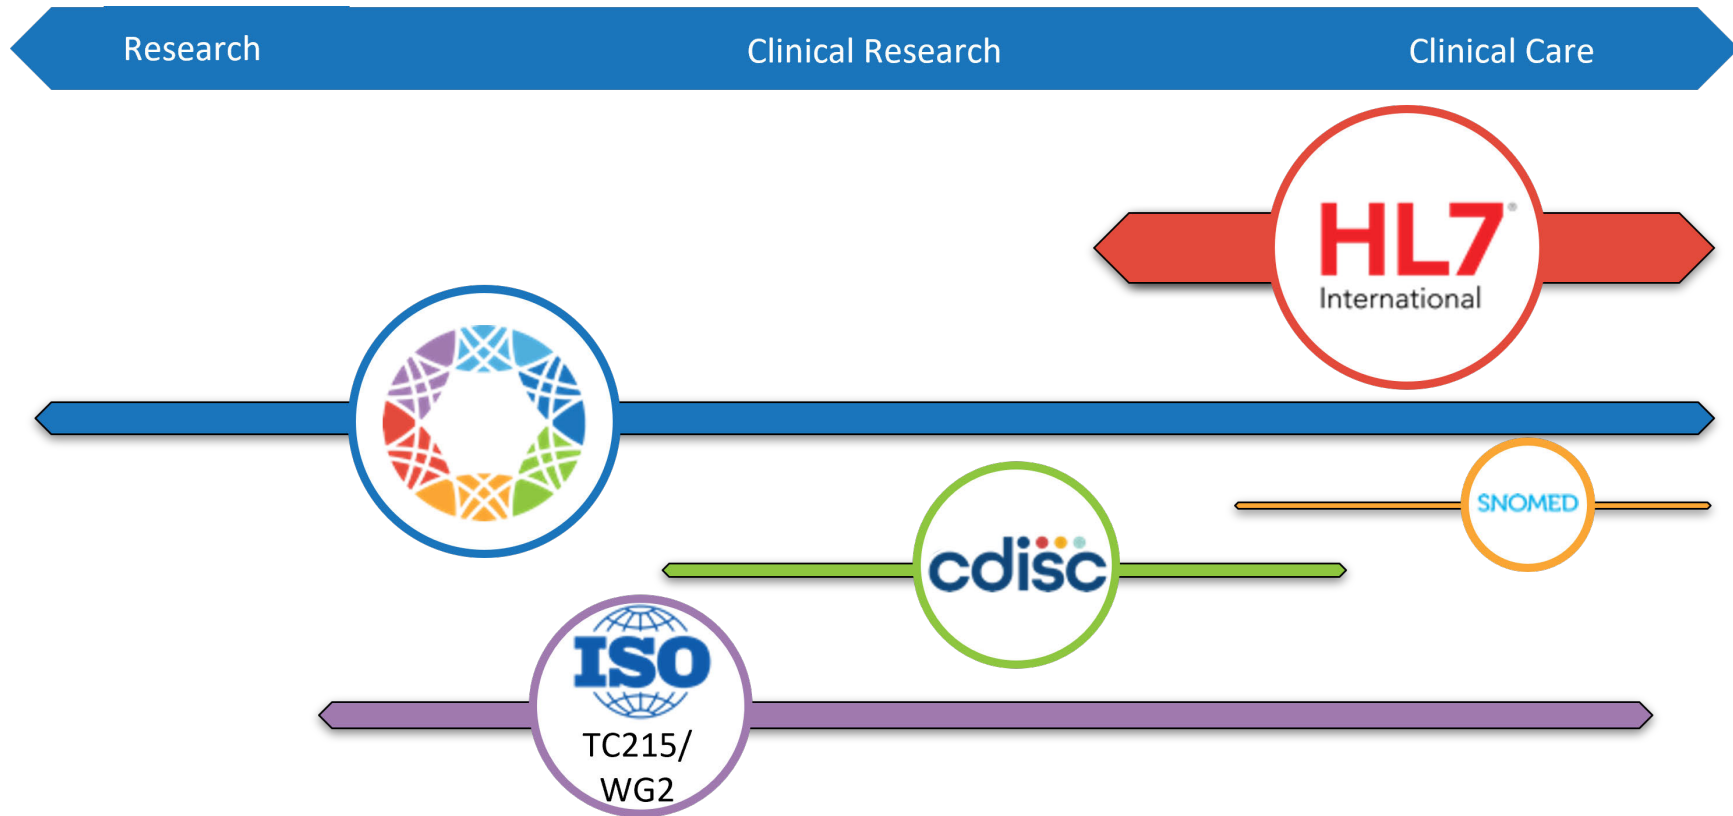

## Interoperable

- Phenotype Representation
- Phenopackets/FIHR
- Pedigree Representation
- Genetic Variant File Formats
- Read File Formats
- RNASeq Expression Matrix
- RNASeq API
- Crypt4GH
- Variant Annotation
- Variant Representation
- Task Execution Service
- Testbed Interoperability Demonstration
- Tool Registry Service
- Workflow Execution Service

## Reusable

- htsgen Streaming API
- refget API
- Variant Annotation
- Workflow Execution Service
- Testbed Interoperability Demonstration

# Alignment With Other Genomics Standards Organizations

# Different Approaches to Data Sharing

## Central Database

Genomic knowledge base

Aggregate data globally

Download and analyze locally

## Secure Cloud

Large-scale research datasets

Aggregate data globally

Analyze centrally in secure cloud

## Federation

Connecting national genomics initiatives

Host data locally

Visit data remotely and collate results

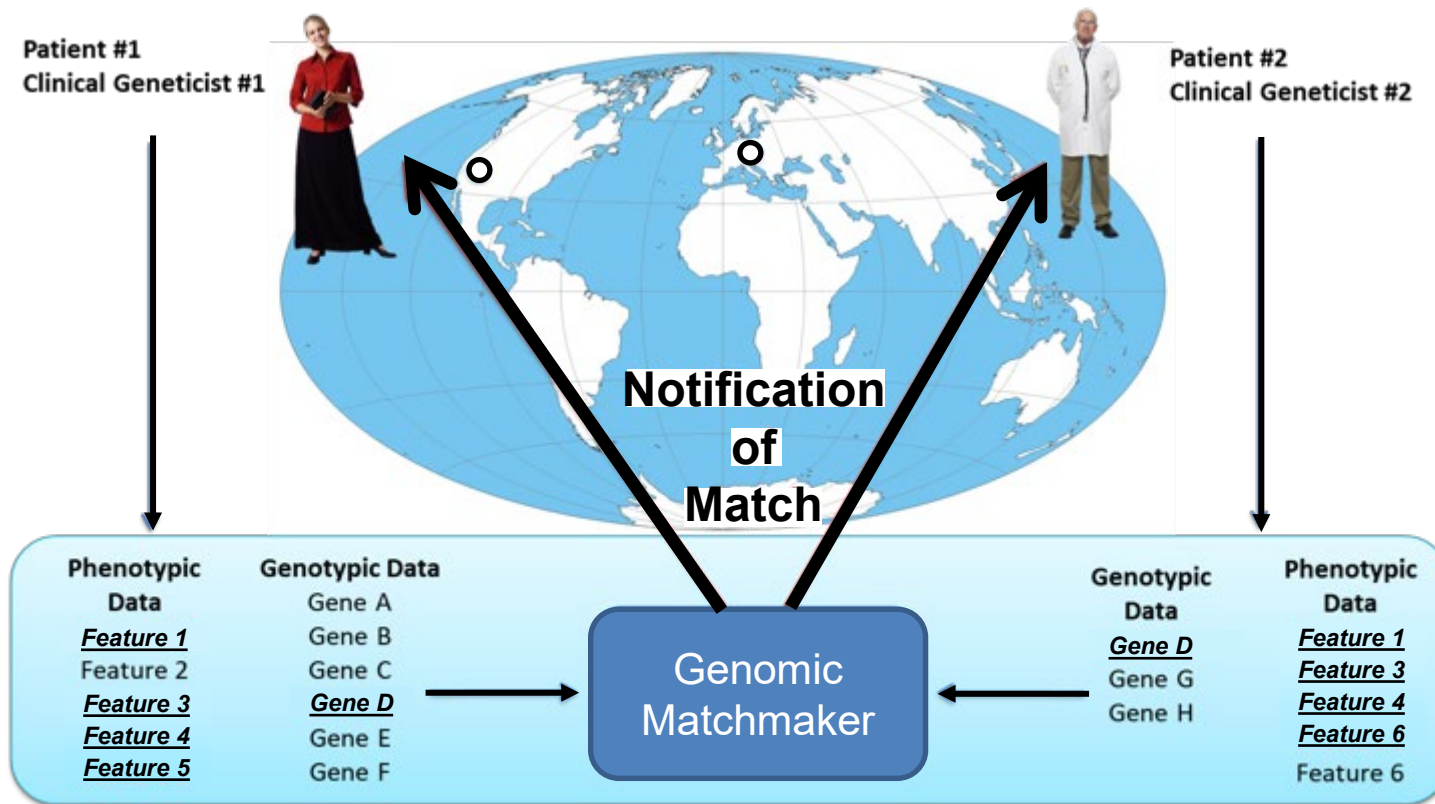

User

→ Data transmission

==> Secure access

# Rare Disease Genomic Matchmaking

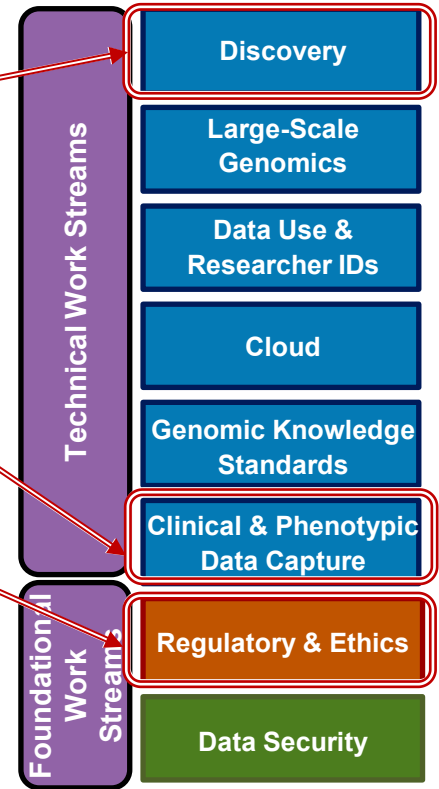

*A Use Case for Federation*

# Developing the MME Federated Network Using GA4GH Standards

## Use of GA4GH standards:

- API for data exchange
  - ID (Mandatory) +/- Label
  - Submitter (Mandatory)
  - Phenotypic Features and/or Gene Names (Mandatory)
  - Disorders (Optional)—OMIM or OrphaNet
  - Sex, Age of Onset, Inheritance (Optional)
- Clinical and phenotypic data capture standards
- Consent framework for data sharing

Philippakis et al. **The Matchmaker Exchange: a platform for rare disease gene discovery.** *Hum Mutat.* 2015;36(10):915–21.

Buske et al. **The Matchmaker Exchange API: automating patient matching through the exchange of structured phenotypic and genotypic profiles.** *Hum Mutat.* 2015;36(10):922–7.

16 papers in a special issue of *Human Mutation* (Vol 36, Issue 10, Oct 2015)

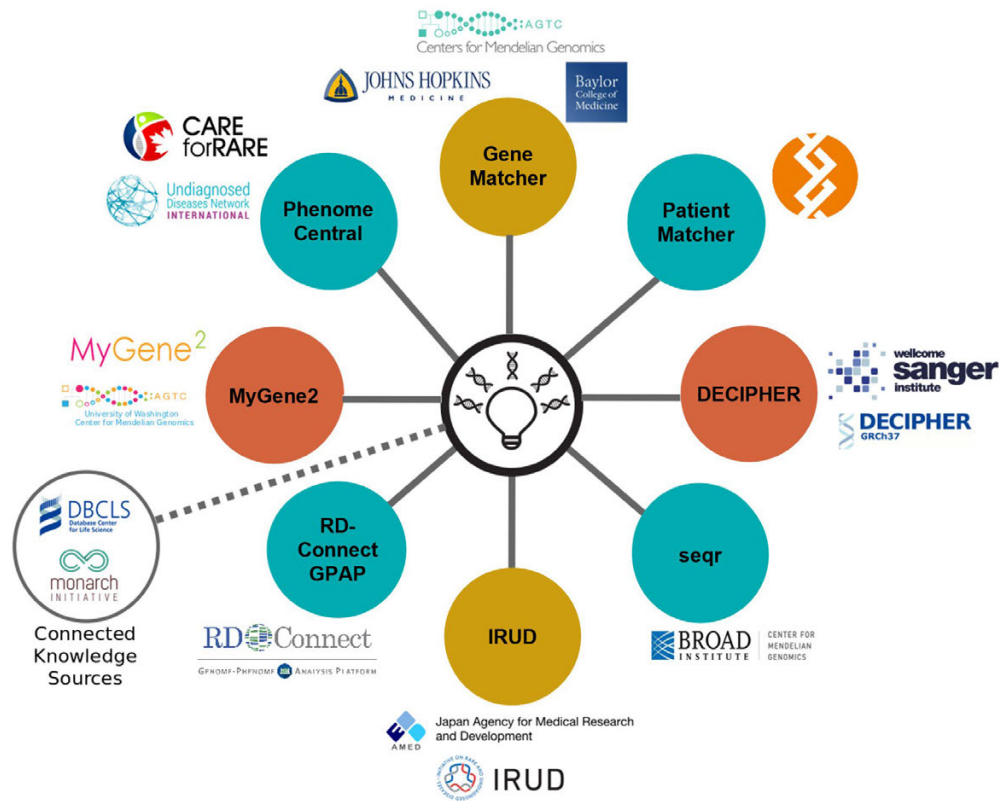

# The Matchmaker Exchange

## Supporting the Discovery of Novel Causes of Rare Disease

### *A Successful Example of a Federated Platform*

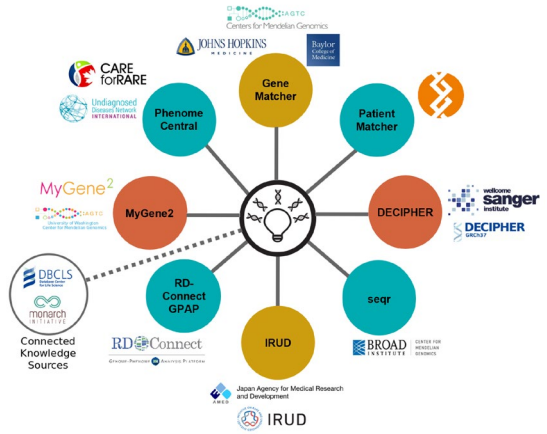

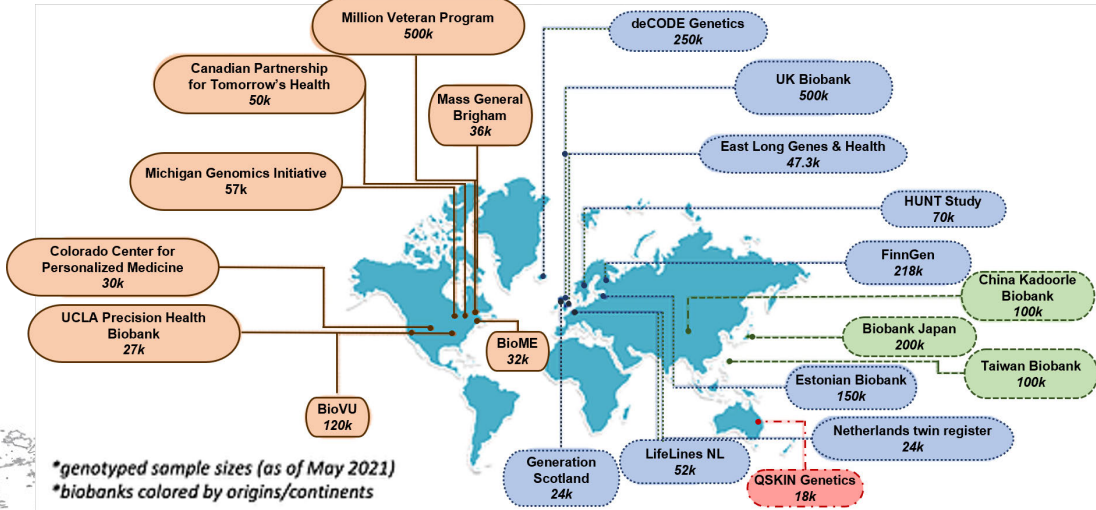

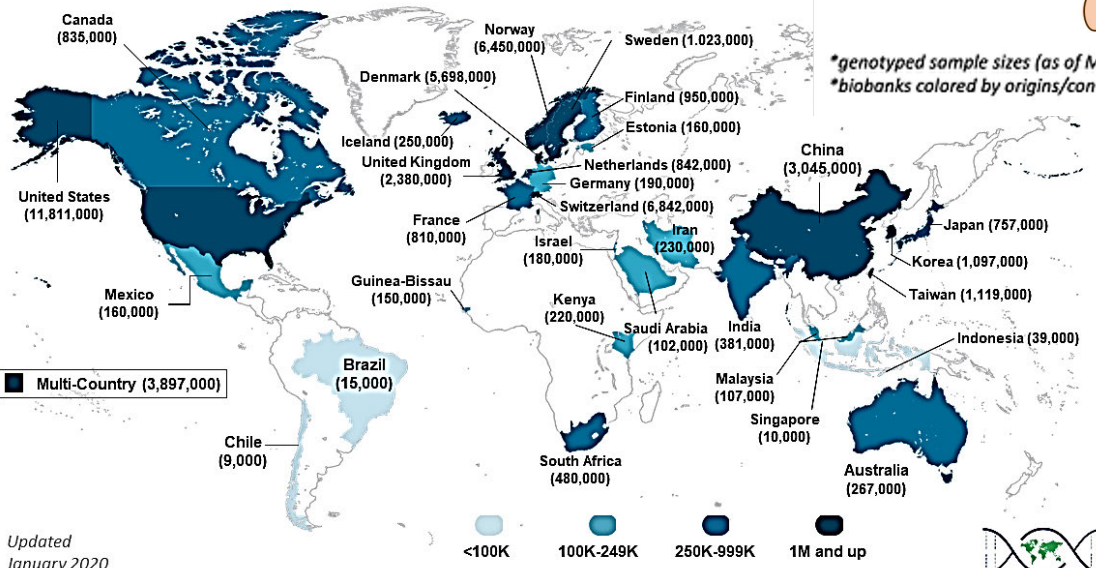

[www.matchmakerexchange.org](http://www.matchmakerexchange.org)

# Datasets Around the Globe

21 biobanks with different origins and ancestries have joined GBMI  
 >2.6 million genotyped samples

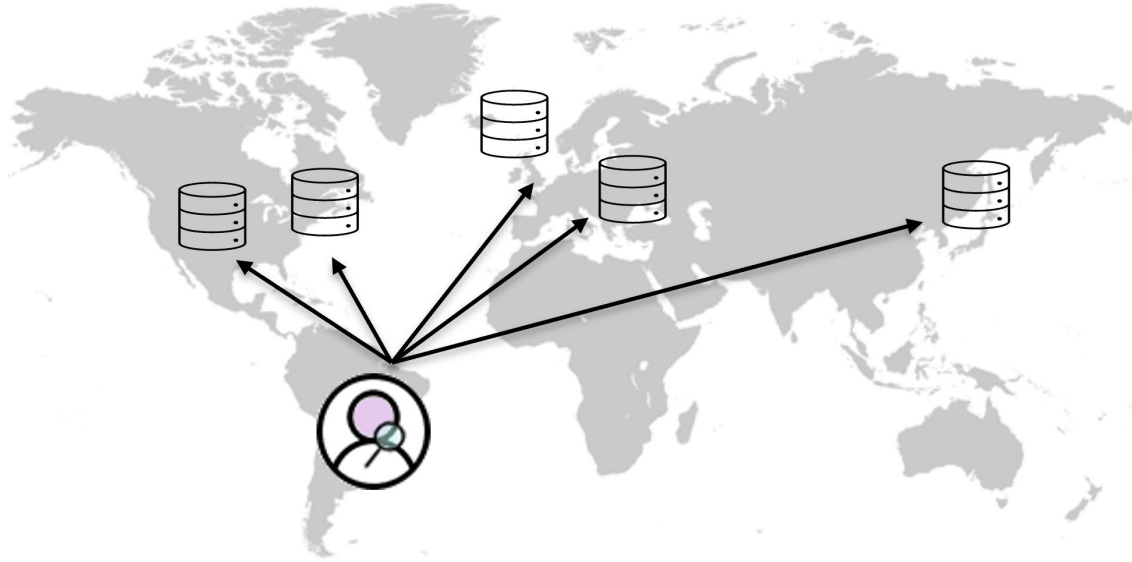

## IHCC Member Cohorts across the World

Updated January 2020

# Federated Data Ecosystems

---

Requires more sophisticated models for data access and analysis

# All of Us Research Program Model for Data Access

## Data Tiers

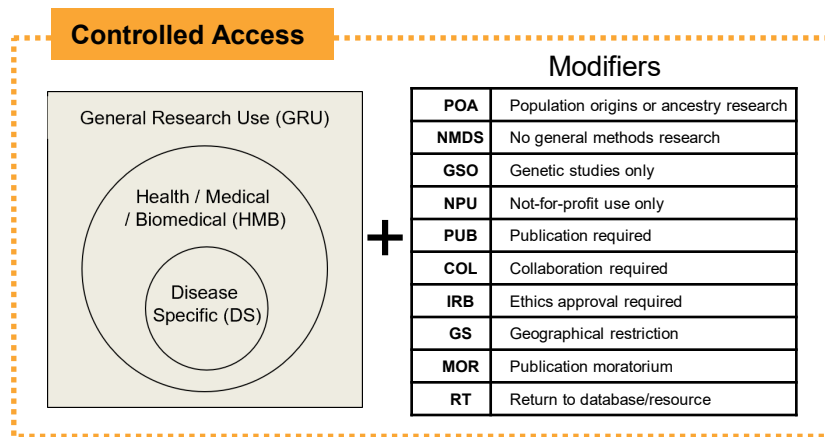

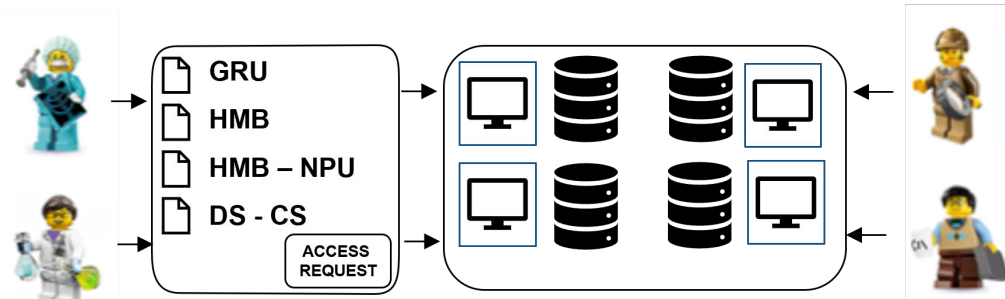

- Public—data with **minimal risk** to participant privacy
- Registered—data with **some privacy risk** to participants
- Controlled—data with most **significant privacy risks**—researchers must be approved by a DAC to access it

Access granted as **researcher-based**, rather than project-based, using a **data passport**

# Data Use Ontology v1

The Data Use Ontology (DUO) allows users to semantically tag genomic datasets with usage restrictions, allowing these sets to become automatically discoverable based on a health, clinical, or biomedical researcher's authorization level or intended use.

**Approved:** January 28, 2019

**Example Users**

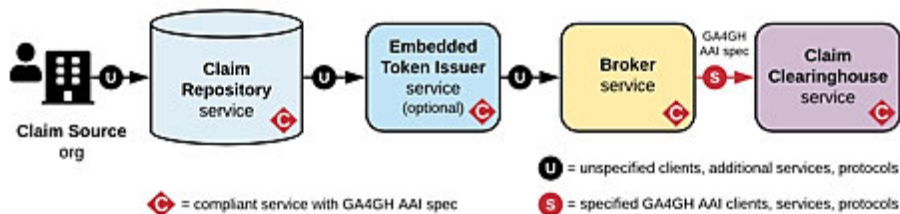

# GA4GH Passports v1 and AAI

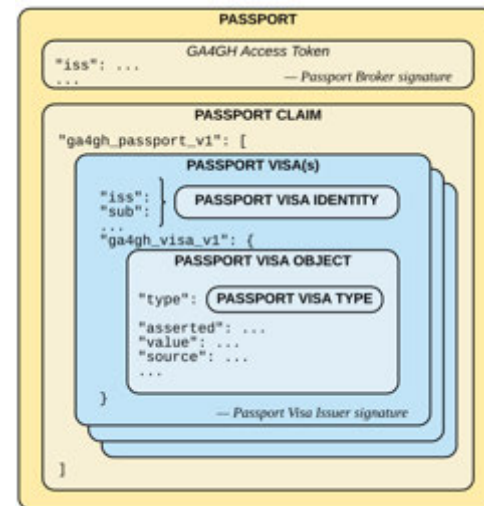

The GA4GH Passports and Authentication & Authorization Infrastructure standards work together to reliably authenticate a researcher's digital identity and automate their access to requested genomic datasets.

**Approved:** October 23, 2019
