COVID-related challenges: Tech site experiences

NIH HEAL Initiative and Helping to End Addiction Long-term are service marks of the U.S. Department of Health and Human Services.

Clinical Research in the COVID Era: UC San Francisco Experience

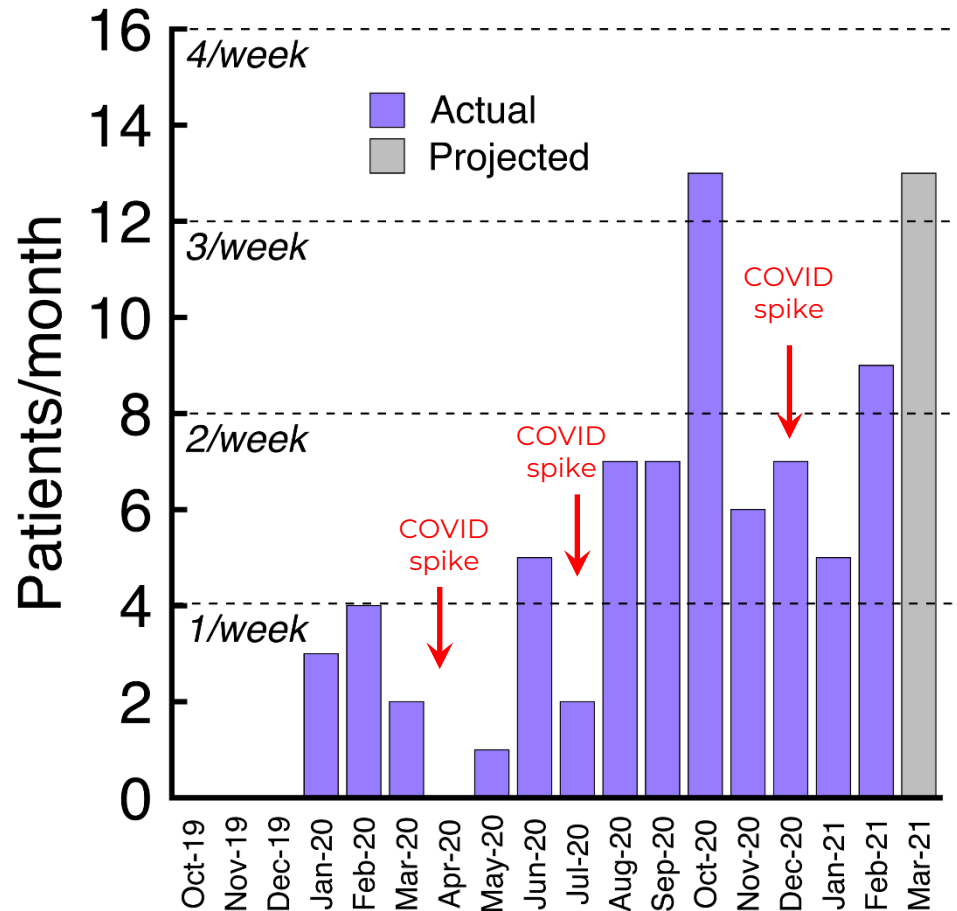

- Novel imaging of endplate biomarkers in chronic low back pain (Fields/Krug)
 - Cross-sectional MRI study of cLBP patients

Changes to research protocols

- Changes to in-person clinical research
 - Phone screening for current/recent symptoms
 - All recruitment activities are conducted remotely instead of in-clinic
 - Social distancing and reduced personnel density
 - MRI cleaning in between patients
- Changes to non-essential basic research: all remote
 - New software required for personal computers
 - Increased time required for computationally intensive operations

Recruitment inconsistencies

- Lower recruitment following local spikes in COVID case rates
 - State-mandated shelter-in-place orders
 - Reduced clinical volume
 - Patients concerned about visiting medical center
- Result = inconsistency
 - Creates irregular workflows (“whiplash effect”)
 - Scheduling difficulties

Challenges/solutions

- Lower clinic volume/reduced enrollment
 - CTSI EMR query and email/letter service
 - >50% drop in response rate compared to pre-COVID (7.6% response rate vs. 18% response rate)
- Safety concerns about using public transit
 - ~~Provide private transportation vouchers, e.g. Uber/LYFT~~
- Remote work = fewer patients commuting to San Francisco
- Remote learning = parents unable to leave home during the day
- Remote work and remote learning has made collaboration and communication between members of the research team difficult
 - Slack/Zoom/Teams (imperfect)
- Inventory shortages for critical supplies (cryovials, conicals)

Pre-clinical Translation Research in the COVID Era: University of Utah Experience

- MR-guided Focused Ultrasound
Neuromodulation of the Dorsal Root
Ganglion for the Mitigation of Low Back Pain
 - Large animal pain model – swine neuritis
neuropathic pain model
 - Multi-disciplinary (Engineering, MR expertise,
neurophysiology, neurology, pain medicine, spine
intervention)

UH2: Pre-clinical Translation

- Challenges
 - Scheduling (2-4 mon- now 6 mon in advance)
 - Experts, vet staff, MRI scanner availability
 - Limitations on when MRI and EEG/SEP experiments could be performed (limited vet staff)
 - Personnel restrictions
 - No undergraduate or graduate students from March until December
 - University hiring freeze
 - Multiple COVID exposures led to limitations of experts or vet staff available due to quarantine

UH2: Pre-clinical Translation

- Challenges
 - Animal restrictions
 - Complete moratorium of animal experiments –waiver to complete animal studies for those animals that were already in house (March – June)
 - Limitations on number of animals we could bring in at any one time after moratorium expired

UH2: Pre-clinical Translation

- Experiments
 - Limited number of investigators (2-3)
 - Closely enforced 6 feet separation
 - Challenging for surgeries
 - Participating in animal behavior testing (QST)
 - MRI-guided focused ultrasound procedures require different expertise
 - Engineers, FUS, MRI, clinical
 - Lab manager
 - Vet staff
 - EEG/SEP recording require expertise in neurophysiology, clinical neurology and pain management
 - Lab manager
 - Vet Staff

UH2: Pre-clinical Translation

- Delayed experiments
- Delayed data acquisition
 - Manuscripts
 - Preliminary data for future grants
- Delayed transition to UH3

Discussion: common challenges

- Revisions to research protocols to accomplish research goals/objectives under COVID constraints
- Scheduling of in-person research activities
- Unforeseen changes to workflow and increased time associated with performing data processing/analysis remotely
