TOTAL SURVEY ERROR AND THE NBS

This page has been left blank for double-sided copying.

I. INTRODUCTION

Total Survey Error (TSE) is a framework for systematically considering the accumulation of error across different phases of the survey process including survey design, administration, data processing, and data analysis (Biemer, 2010). At each phase, errors in coverage, specification, non-response, measurement, and data processing can negatively impact data quality and increase the bias and variance of population estimates, resulting in questionable findings. The goal of the NBS design was to minimize the size of these errors within the cost constraints of the survey. In doing so, we identified the sources of error most likely to impact estimates for this population and survey and focused on design features that would mitigate those, keeping in mind that there are often tradeoffs in error reduction. For example increasing efforts to persuade reluctant sample members can result in larger measurement error and increase bias in estimates.

This discussion focuses on non-sampling error, that is error that is not related to sampling or coverage (errors that occur when the sampling frame does not represent the target population). Table 1 provides a brief description of the different types of non-sampling error, as described by Biemer (2010). Error related to sampling is not discussed since this error is assumed to be minimal in the NBS.

Table 1. Sources of Error

Sources of Error	Description
Specification	Error that results when the concept intended to be measured by the question is not the same as the concept the respondent ascribes to the question.
Unit Non-response	Error that occurs when selected sample member is unwilling or unable to participate (failure to interview). Can result in increased variance and potential for bias in estimates if non-responders have different characteristics than responders.
Item Non-response	Error that results when items are left blank or the respondent reports that he/she does not know the answer or refuses to provide an answer (failure to obtain and record data for all items). Can result in increased variance and potential bias in estimates if non-responders have different characteristics than responders.
Measurement Error	Errors that occur as a result of the respondent or interviewer providing incorrect information (either intentionally or unintentionally). May result from inherent differences in interview mode.
Data Processing Errors	Errors in data entry, coding, weighting, and/or analyses.

In the case of the NBS, we made efforts to reduce errors stemming from all of these sources, but placed particular importance on reducing unit non-response and measurement error. This was largely because persons with disabilities, particularly those receiving SSI, are often hard-to-reach and interview. Additionally sample members had a wide range of disabilities, including physical and cognitive impairments. We were keenly aware of the need to design the survey in a way that would reduce minimize errors in reporting. For example, a respondent with a cognitive impairment may inaccurately report information because he is unable to remember specific dates, times, or the amount of money received from different sources, increasing measurement error. Similarly, an individual with a physical limitation causing fatigue may become tired during the survey effort and

misreport information. Alternatively someone answering the survey on behalf of the sample person may provide different responses than the individual would have given themselves. Thus, we designed the survey with accessibility in mind and weighed the cost and benefits of approaches to foster inclusion and adequate representation of this population. Special attention was paid to the instrument design, reducing barriers to survey response, and interviewing procedures. In Table 2 we summarize the key sources of error identified on the NBS, our procedures for mitigating each error, and our assessment of its relative impact on data quality. We follow with a detailed discussion of each source of error and the efforts taken to minimize impact on the survey data.

II. SOURCES OF ERROR

A. Unit Non-Response

Unit non-response occurs when a sample member does not participate in the survey. This may occur because the sample member does not want to participate (refuses), has an impairment that precludes participation, or is simply unlocateable. When unit non-response is high, there is potential for bias if responders have different characteristics than non-responders. For example, if unit non-response is high among individuals with more severe disabilities, the results about employment may be biased.

1. Minimizing Unit Non-Response on the NBS

- The NBS was designed as a dual-mode survey to provide varied opportunities to find, contact, and interview beneficiaries. While attempting in-person interviews for all sampled persons may have produced the highest response rates, offering a dual-mode survey in which initial attempts were made by telephone using Computer-Assisted Interviewing (CATI) and employing Computer-Assisted Personal Interviewing (CAPI) only as a follow-up for non-responders, offered significant cost savings and provided a balance between cost and maximizing response. It should be noted however, that due to the sample design, not all beneficiaries were eligible for CAPI follow-ups. Individuals who lived outside pre-specified geographic clustered did not receive in-person locating or interviewing. While this could have introduced systematic bias into estimates, it was considered a necessary tradeoff to control costs.
- Interviewers were trained extensively in refusal avoidance techniques. This included reviewing frequently asked questions as well as role-playing refusal avoidance. During CATI interviewing, monitors provided interviewers with real-time feedback and suggestions related to refusal avoidance.
- We conducted extensive locating efforts in advance of and throughout the data collection period. This included LexisNexis/Accurint searches prior to and during the data collection period, reverse directory look-ups, and intensive case-by-case efforts by in-house locating staff. If a telephone number could still not be located, the case was sent to a field interviewer for in-person locating. On average, cases that required locating received 1.5 hours of effort. Using these means, we successfully located approximately 70 percent of the sample.
- An advance letter mailed to all sample members prior to data collection promised a \$10 monetary incentive to help reduce unit non-response. In the last six weeks of the field period, the post-pay incentive became a prepay incentive with all remaining non-responders receiving a check in the mail prior to an attempted interview.
- We attempted to reduce barriers to participation in the survey by providing options to conduct the survey using Teletypewriter (TTY), Telecommunications Relay Service (TRS), instant messaging, or interviewing the sample person in-person.
- If a sample member could not respond to the survey him or herself due to a severe cognitive impairment, an assisted or proxy interview was permitted. The need for a proxy interview was determined using an innovative cognitive screener administered to all sample members prior to the start of the survey.

- We computed adjusted weights for two phases of nonresponse (location and completion). In our experience with the NBS, factors associated with the inability to locate a person tend to differ from factors associated with cooperation. The unlocated person generally does not deliberately avoid or otherwise refuse to cooperate. For instance, that person may have chosen not to list his or her phone number or may frequently move from one address to another, even though there is no evidence to suggest that, once located, he or she would show a specific unwillingness to cooperate with the survey. Located nonrespondents, on the other hand, may deliberately avoid the interviewer or express displeasure or hostility toward surveys in general or SSA in particular. Thus we calculated the adjustment factor in two stages: (1) by estimating a propensity score for locating a sample member and (2) by estimating a propensity score for response among these located sample members. A full discussion of the impact of non-response bias and adequacy of the nonresponse adjustments is available in the “National Beneficiary Survey Round 4: Nonresponse Bias Analysis” (Grau et al. 2012).

B. Item Non- Response

Item nonresponse occurs when a respondent indicates that he or she does not know the answer to a question or refuses to provide an answer to the question. High levels of nonresponse on a particular survey item can result in increased variance of the estimate for that item and, when nonresponse is sufficiently high, the survey item can be rendered useless by the end-user.

Item nonresponse results for a myriad of reasons including, but not limited to, a true lack of knowledge, lack of desire to answer items perceived as ‘too personal’, inability to comprehend the question, inability to recall specific information, difficulty providing responses within the prescribed response categories, or disinterest in the survey item.

1. Approaches to Minimizing Item Non-Response on the NBS

- While few items in the NBS were sensitive, items were included which asked respondents to report on alcohol and drug use and earnings. To alleviate concerns about sensitive information being shared with SSA or other external parties, respondents were assured at the beginning of the interview that all of the information they provided would be kept confidential and interviewers re-iterated this as necessary during the interview.
- If respondents refused to answer, or responded “don’t know” to questions about earnings and income, we probed with a follow-up question asking respondents to identify in which range their income fell.
- Within the survey instrument, probes and definitions were made available to the interviewer, to read as necessary. For example, sample members are often unclear about whether they have Medicare or Medicaid insurance and may require additional information to help them answer the question.
- We allowed sample member to receive assistance with survey questions if they lacked the information necessary to answer the question. For example, a sample member may not know what month and year he started a particular program. If a knowledgeable person was available, the sample member was allowed to ask the person for help answering the item.

- The NBS data collection instruments were administered with computer-assisted interviewing (CAI) technology which allowed the use of automated routing to move to the applicable questions and performed checks of the entered data for consistency and reasonableness during the interview. In addition, it did not permit a question to be left blank; therefore, the interviewer could not proceed until an appropriate response was entered (“don’t know” and “refused” are included as response options and used as necessary). These processes substantially reduced the extent of item nonresponse for this survey, although some item nonresponse persisted as when a “don’t know” or “refused” was recorded as a response. For key items that were identified in advance as critical to analyses, we imputed missing data primarily using two methods of imputation to compensate for item nonresponse: deductive (or logical) imputation and unweighted hot-deck imputation.

It should be noted that a small number of items were not asked of proxy respondents. Items that were skipped included subjective items about satisfaction with services and those asking what respondents knew and did know about specific programs. This was done to minimize bias resulting from measurement error since proxies would not be able to report accurately on such items, but does result in higher non-response for these items. Additionally, it is possible that more impaired respondents (those who required a proxy) would have systematically reported more or less satisfaction with or knowledge of services than those who responded to these items. It is unclear if this bias occurred and, if it did, in what direction.

C. Specification Error

Specification error occurs when the intended concept of question is not what the respondent actually considers when formulating a response. This can result in data that lacks internal validity; that is, what is intended to be measured is not being measured.

1. Approaches to Minimizing Specification Error on the NBS

- Instrument development included cognitive testing to determine how respondents interpreted key questions before responding.¹ Modifications to the questionnaire were made based on these initial findings.
- After revisions were made to prepare the questionnaire for CATI and CAPI programming, an additional pretest was conducted by Mathematica. Minor wording changes were made after pretesting based on feedback obtained during interviewer debriefings.
- Whenever possible, we used existing and well validated items making minor modifications as needed to suit the population and topic. Many questions came from other SSA surveys or surveys conducted by other Federal agencies. Others, such as the SF-8TM scale, were obtained with licensing agreements if necessary.
- In the early stages of NBS interviewing, both CATI and CAPI interviewers participated in a series of debriefings designed to provide the research team with more information

¹ Cognitive testing was conducted under a separate contract by Westat.

about what was working well with the survey and whether there were still items that were confusing for the respondent or difficult to answer. Based on these discussions, probes and definitions were added if needed to clarify questions.

- Minor modifications were made to some survey items between rounds if the data or feedback from interviewers suggested a change was needed. For example, after Round 1, we determined that respondents were confused about the following question, “Did {you/NAME} receive any food stamps last month? This only includes food stamps received by {you/NAME}, not other family members.” In subsequent rounds the item was revised to read “Did {you/NAME} receive any food stamps last month? Please include only food stamps {you/NAME} received for {you/NAME} and {your/NAME’s} family. Do not include food stamps received separately by other members of [your/NAME’s} household.”
- The NBS was translated into Spanish and administered by trained and certified bilingual interviewers to minimize language comprehension problems for Spanish speaking respondents. In twenty-five cases, the potential respondent could not complete the language in either English or Spanish. Since there were so few cases, we did not attempt to conduct interviews with these respondents. Bias may result from excluding these sample members; however, we believe error resulting from this source is negligible, given the low occurrence.

D. Measurement Error

Measurement error occurs when the response provided differs from the real value. Such error can be the result of characteristics or actions of the respondent or interviewer, characteristics of the survey instrument, or characteristics of the environment. In this section, we discuss each source (respondent, interviewer, instrumentation, and environment) and follow with a description of efforts taken to minimize their impact in the NBS.

1. Respondent-Based Measurement Error

Respondents may contribute to TSE by providing, knowingly or unknowingly, inaccurate responses to survey questions. There are many reasons this may occur including challenges associated with recall, a desire to please the interviewer, and a lack of interest in the survey. Reducing respondent-based measurement error was a particular focus of this survey since many NBS sample members had mental and physical impairments that could make processing of information and providing a response difficult, including brain injuries, mental retardation, autism, psychiatric disorders, and deafness. Our challenge was to collect detailed, accurate information during a lengthy interview from individuals with a variety of health conditions and impairments. We identified several barriers to successful interviewing including cognitive and stamina issues and identified methods to overcome them.

a. Approaches to Minimizing Respondent-Based Measurement Error on the NBS

- An important component of offsetting cognitive and stamina barriers was careful attention to instrument design, including the use of structured probes, simplifying questionnaire wording, and suggested stopping points. We also conducted specialized interviewer training designed to sensitize interviewers to common challenges associated with telephone interviews of persons with disabilities. In addition, as mentioned above,

we trained interviewers to identify and use appropriate accommodations such as TTY, TRS, amplifiers, and instant messaging technology to minimize challenges associated with interviewing persons with speech or hearing impairments.

- When necessary, we allowed respondents to receive assistance from someone knowledgeable (such as a parent or other family member) for items that were particularly challenging, such as providing names of services received, amount of earnings, insurance type, and so on. For some items, we allowed the interviewer to assist the respondent with mathematical calculations. For example, the interviewer was allowed to sum values the respondent provided to generate the single monetary amount to enter as the response.
- If a respondent's cognitive barrier was such that his or her ability to comprehend the nature of the survey was in doubt, a proxy respondent was sought. This was determined through the administration of a cognitive screener (administered to all respondents) or through information gathered by a knowledgeable gatekeeper. It should be noted that the cognitive screener used for the NBS has not been formally validated against another comparable measure. Thus, while the purpose of the screener was to standardize interview assessments of respondents' cognitive abilities, it is unknown how many false positives (screening people out who could have completed the survey) and false negatives (screening people in that may not have understood the survey question) were obtained. We do not know the extent to which this may have contributed to measurement error. Bias may have been introduced by proxies who did not provide information as accurate information as what the sample person could have provided him or herself. Conversely, a sample member may have provided erroneous answers if they participated when they did not comprehend the questions.
- Respondents, particularly those with severe health impairments, may become disinterested during the survey or simply fatigued. As a result, they may not fully process each question, but rather simply provide the same response to a series of like items, regardless of the accuracy of their responses. Interviewers were trained to recognize the signs and to 'check in' with the respondent to see if a rest break was needed or to encourage participation to complete the survey, if nearing the end of the survey.
- The NBS included items which asked respondents about events that occurred in the prior year. We employed several techniques to aid respondent recall including pre-filling names, dates, and the names of providers the respondent received services from. In addition we assured respondents that their best estimates were fine when they were asked to provide earnings or income information and allowed them to report in whatever unit was easiest for them (e.g. hourly, weekly, bi-weekly, monthly, or annually income).
- Hard and soft edits were incorporated into the survey instrument to identify potential errors in respondent reporting as well as potential error in interviewer data entry. If a respondent reported discrepant information or an out of range value, a soft or hard edit would appear, instructing the interviewer to further question the respondent to gather the current information (or to note an exception explaining the reported information).
- Finally, to reduce concerns that individual responses will be shared with SSA or others beyond the project team, an advance letter mailed to all sample persons assured beneficiaries that their individual responses would be kept confidential. This was reiterated at the start of the interview and as needed throughout.

2. Interviewer-Based Measurement Error

Interviewers can also negatively impact data quality. A simple example is when an optional probe could be useful to the respondent is left unread, or when no probe is available and the interviewer decides to explain the meaning of the question to the respondent using his or her own words. In both instances, the respondent's ability to accurately respond is jeopardized because, in the former case, there is a lack of clarifying information and, in the latter case, there is the potential for the provision of erroneous information. Through careful interviewer recruitment and hiring, intensive training, and ongoing supervision, monitoring, and feedback, measurement error attributable to interviewers can be minimized.

a. Approaches to Minimizing Interviewer-Based Measurement Error on the NBS

- Our first step towards reducing interview-based error was recruiting and hiring high quality interviewers. The vast majority of CATI and CAPI interviewers had experience interviewing on previous rounds of the NBS or had worked on other disability-related projects at Mathematica. All interviewers underwent criminal background checks and received security clearance from SSA.
- Interviewer training was intensive and thorough. In addition to Mathematica's standard eight hour general interviewer training, telephone interviewers received a two day, and in-person interviewers received a three day, project specific training. In training, we covered: a general project overview, a description of data collection and the sample, sensitivity awareness related to interviewing persons with a disability, frequently asked questions and refusal avoidance, conducting assisted and proxy interviews, probing for medical condition, probing for occupation, and a question-by-question walkthrough of the instrument. In-person interviewers received additional training on field-related activities such locating and laptop management. Interviewers were required to pass a certification process before they were qualified to conduct interviews.
- During data collection, telephone interviewers were monitored continuously by the research team and operations supervisors. A minimum of 10 percent of all calls each telephone interviewer made were monitored by a supervisor who listened to live interviews and viewed screen movement. They recorded information about communication with the sample member or proxy (verbal clarity, ease of dialogue), data entry accuracy, and any problems that were observed or heard and provided feedback to interviewers immediately at the end of the interview. Similarly a minimum of 10 percent of all contacts in-person interviewers made were validated by contacting respondents after the interviewer reported completing the interview to ask about the interview. Attempts to reach respondents were first made by mail with follow-up telephone calls made if no response was received.
- In-person field interviewers were not monitored live. Because in-field monitoring is costly (involving sending a second interviewer on visits or special equipment), we instead required that all interviewers were "certified" before interviewing began and validated a minimum of 10 percent of each interviewer's completed cases. During the certification process, interviewers were required to practice several mock interviews with a trainer (including activities that should occur before and after interviewing per the interviewing protocol). Once deemed proficient by an interviewing supervisor, the interviewer was deemed 'certified'. Validation of interviews involved contacting randomly selected

respondents (by mail and phone) and asking questions about the length of the interview, the types of questions asked, and whether a computer was used. If a respondent reported information that raised concerns; for example, interview took 10 minutes or no computer was used, the interviewer's field manager contacted the interviewer for an explanation. Field manager followed up on 15 cases; none were found to be fraudulent interviews.

3. Instrument-Related Measurement Error

An instrument that is poorly designed can increase measurement error. Questions that lack clarity, instructions that are confusing, and terms that are easily misunderstood can result in respondents reporting erroneous information or interviewers providing unclear instructions. Further, since NBS was administered via both CATI and CAPI, programming errors and mode effects could have contributed to overall survey error.

a. Approaches to Minimizing Instrument-Related Measurement Error on the NBS

- As mentioned previously, the survey underwent extensive cognitive testing and pretesting prior to fielding. Pretesting allowed a full review of the interviewing process including the introduction, screening respondents, and conducting the full interview.
- Mode of data collection, telephone versus in-person, may result in differences in the quality of data collected. To minimize mode effects for this survey, the questionnaire was identical in each mode. Because both modalities involved an interviewer and few items were sensitive, mode effects were expected to be minimal.
- We conducted intensive testing of both the CATI and CAPI instruments prior to the start of data collection to minimize errors associated with programming. At Round 4, testing focused on changes made to the instrument since the previous data collection round. Testers were given testing scenarios and asked to note issues regarding skip patterns, pre-fill information, question wording, and answer options. Once testing was completed, modifications were made by programmers and a final review was conducted.
- We conducted a frequency review of the first 200 completed cases. The review focused on indentifying potential skip pattern issues and data entry issues. Problems were addressed either through programming changes or interviewer re-training. Additional frequency reviews were conducted throughout the data collection period.

4. Environment-Related Measurement Error

In some cases, the environment may impact the respondent's ability to be attentive and provide accurate responses or the interviewer's ability to conduct the interview in a smooth, coherent fashion. For example, a crying baby being held by the respondent during an interview will likely distract both the respondent and the interviewer and can make questions difficult to hear, process, and answer. The result could be high levels of item non-response or the provision of erroneous information by the respondent.

a. Approaches to Minimizing Environmental-Related Measurement Error on the NBS

- Interviewers were trained to assess the environment before and during the interview to determine whether a noise distraction such as other individuals in the area or a television

was interfering with the interview process. If it was determined that such a distraction existed, interviewers made every attempt to change the environment through polite suggestions such as relocating to another part of the space available or asking if the distraction could be minimized for the duration of the interview.

- Interviewers were trained to conduct the interview at a convenient time for the sample member and to suggest a call-back if respondents did not want to participate when called or needed to stop the interview before finishing.
- Ensuring respondents' privacy during the interview was essential to gathering accurate answers. Interviewers were trained to be aware of cues that the respondent was concerned that others could hear their responses. If such instances occurred, interviewers suggested changing the conditions of the interview such as relocating to a different part of the house or turning away from an area.

5. Data Processing Error

Errors in data processing can occur as a result of errors in data entry, errors in coding, or error in weighting or analysis activities.

a. Approaches to Minimizing Data Processing Errors on the NBS

- We incorporated a number of hard and soft edits into the computer assisted interviewing program to minimize data entry errors during the interview. For example, if the interviewer entered a date in the future, a hard edit appeared that prompted him or her to correct their mistake. If a respondent reported a large discrepancy between pre- and post-tax pay, a soft edit appeared prompting the interviewer to confirm what he or she had entered.
- Several questions in the NBS required coding of verbatim response including items about disabling conditions, occupation and industry, and items allowing an 'other' response. To ensure consistent coding of verbatim responses we conducted a comprehensive coder trainer. A minimum of 10 percent of all coded items were reviewed by research staff or an operations supervisor. Coders referred all questions to a supervisor and coding decisions were logged for future reference. Details of the coding procedures can be found in the National Beneficiary Survey Round 4: Editing, Coding, Imputation, and Weighting Procedures (Grau et al. 2012).
- The questionnaire was programmed in Blaise, which is self-cleaning. Responses that are become off-path if an interviewer backs up and changes a response are deleted. Nevertheless, we conducted an intensive review of the survey data including running several edit checks to identify consistency or skip pattern problems. We edited improbable or out-of-range responses and imputed missing data on key items. If systematic errors were identified, we revised items in subsequent rounds.
- Code used to create participant, beneficiary, and combined weights, as well as imputation code, was reviewed by a senior statistician as part of a quality assurance process. In some cases the review resulted in revising the code and recreating weights or imputed values while others required further explanation by the project statistician.

III. THE IMPACT OF TSE ON DATA QUALITY FOR THE NBS

The cumulative impact of TSE is difficult to measure. To evaluate the impact of TSE on NBS estimates, we examined various indicators of data quality where we reasonably could, namely for the purposes of assessing the impact of unit non-response, item non-response, and measurement error.

A. Unit Non- Response

Because we obtained fewer than the targeted number of completes in most sampling strata at Round 4 and achieved lower than expected response rates, we were particularly concerned about unit non-response error and bias. We conducted a nonresponse bias analysis at the conclusion of data collection, using all 8,017 sample cases, to determine if there were systematic differences between respondents and nonrespondents that could result in nonresponse bias (Grau, et al. 2011). In sum, our analysis indicates that there were minimal systematic differences between responders and non-responders and that the nonresponse adjustment alleviated nearly all differences observed in both the beneficiary and participant samples. There were two exceptions for the beneficiary sample. First, the nonresponse-adjusted weighted estimate of the beneficiary type differed from the frame for Supplemental Security Income (SSI)-only cases, even though the original estimate (including all sampled cases) did not differ from the frame. Second, the nonresponse-adjusted weighted proportion of Asians was significantly less than the frame value.

B. Item Non- Response

As expected, item non-response was not substantial. Item non-response was greater than 5 percent only for select items asking for wages and household income. Nevertheless, we imputed missing data for key items that had been identified in advance as critical to analyses.

C. Measurement Error

We have minimal ability to evaluate the impact of measurement error on the NBS. The best test would be to compare survey responses to an external data source such as SSA administrative data. However, there are few items that are available for this type of analysis (namely insurance type and participation in the Ticket to Work program).

Because we built an experiment into the Round 4 NBS designed to compare data collected via CATI and CAPI, we do have means to assess the impact of interview mode on quality.² Evidence from this study suggests that mode of interview had a modest impact on data quality for this population. In sum, we found that while, telephone and face-to-face respondents exhibited about the same levels of item non-response and non-differentiation in this survey, telephone respondents were more likely to provide “yes” responses to questions about SSA work programs and likelihood of work. This suggests that sample members who were interviewed by telephone may have been more likely to take shortcuts when responding, perhaps because telephone interviewing places higher cognitive demands on them. Due to the constraints on our sample sizes (particularly after excluding proxy interviews for those with cognitive impairments), we were not able to conduct subgroup analyses comparing individuals with physical and cognitive impairments, and thus cannot

² This experiment was funded under a separate contract Mathematica had with NIDRR.

determine if this effect is greater for those with cognitive limitations. Despite the fact that this study was implemented as an experiment, it is still possible that these findings reflect real differences in the two populations; thus the results should be interpreted with caution.

APPENDIX G

DESCRIPTION OF CONSTRUCTED VARIABLES

This page has been left blank for double-sided copying.

Description of Constructed Variables

Variable Name	Description
Sampling Variables and Administrative Variables Used in Survey Administration	
OrgSamplInfo_age	Age of sample member at time of sample selection. Based on date of birth from SSA administrative records.
OrgSamplInfo_Bstatus	Indicates whether sample member receives SSI, SSDI, or both SSI and SSDI. From SSA administrative records.
OrgSamplInfo_DOB	Sample member date of birth from SSA administrative records.
OrgSamplInfo_PSU	Sampling PSU. For beneficiaries, based on zipcode as of June of the year they were sampled. For participants, sample PSU is based on the zipcode at the time the ticket was assigned.
OrgSamplInfo_Release	Sample release number.
OrgSamplInfo_SDate	Date sample frame pulled.
OrgSamplInfo_SSIAGE	Age began receiving SSI benefits. From SSA administrative records.
OrgSamplInfo_Ssdate	Date began receiving SSI benefits. From SSA administrative records.
OrgSamplInfo_Tstatus	Indicates whether sample member was a Ticket to Work Participant at the time of sample selection.
A_PSU	Analytical PSU for variance estimation using SUDAAN. For clustered samples (beneficiaries and participants) A_PSU = PSU identifier. For unclustered Participant sample A_PSU = linkid.
A_Strata	Analytical strata for Beneficiary and Participant samples for variance estimation using SUDAAN. For A_strata the first digit=R3_Orgsampinfo_phase. Among clustered cases (including all cases in the Beneficiary and Traditional payment Ticket Participant samples) all remaining digits are 0. Among unclustered cases in the participant sample, the second digit=R3_C_Paymenttype, the third digit indicates whether the unclustered case was in a psu, and the fourth digit=R3_Frame.
C_Cohort	Age cohort sampling strata for Beneficiary sample. Based on date of birth from SSA administrative records.
Paymt_Prov_Type	Sampling strata variable for Ticket Participant sample. Indicates type of service provider and payment type (SVRA EN, Non-SVRA EN, or SVRA traditional). From SSA administrative records.
Payment_Type	Indicates system under which EN receives payment from SSA (milestone, outcome, or traditional cost reimbursement).
Flagparti	For use with the combined Beneficiary and Ticket Participant sample weight. Identifies Ticket participants who also appear in the Beneficiary sample.

Appendix G (continued)

Variable Name	Description
Clus	Indicates whether the case was in the clustered or unclustered sample. All cases in the Beneficiary sample and Traditional payment Ticket Participant sample are clustered. The Phase 2 Outcomes Only and Milestone and Outcome Participant sample includes both a clustered and unclustered component. Similarly, the Phase 1 and Phase 3 Outcomes Only Participant samples include both a clustered and unclustered component.
Uncinpsu	Among unclustered cases, indicates whether the case was located in a psu or not. For this variable, "0" indicates either an unclustered case that was not in a psu, or a clustered case.
SampGrp	Indicates whether sample member has ticket assigned to EN or SVRA acting as EN or whether ticket is assigned to a traditional SVRA (i.e. "in-use").
OrgSampInfo_Race	Race of sampled beneficiary. From SSA administrative records.
Phase	Phase of Ticket to Work roll-out. Based on state of beneficiary residence at time of sampling.
Survey Administration Variables	
C_Rtype	Indicates whether interview conducted by sample person or proxy. Based on M11.
C_Resptype	Indicates whether the sample person or proxy required assistance from someone else to complete the interview. Based on M12.
C_IntMode	Indicates whether interview conducted via CATI or CAPI.
C_IntAge	Sample member age at interview. Based on date of interview minus self-reported date of birth at A68 or A69.
C_IntDay	Interview day.
C_IntMnth	Interview month.
C_IntYear	Interview year.
Final	Final disposition code
InterviewLanguage	Indicates whether interview conducted in Spanish or non Spanish.
Weights	
Wtr4_Ben	Weights created for beneficiary sample analyses.
Wtr4_Com	Weights created for combined beneficiary and participant sample analyses.
Wtr4_Par	Weights created for participant sample analyses.
Section B Variables: Disability and Current Work Status	
C_DisAge	Indicates age the sample person became disabled. Based on B18_age and B18_yr.

Appendix G (continued)

Variable Name	Description
C_AdultChild_Onset	Indicates whether onset of disability was prior to age 18 or at age 18 and older. Based on B19 and C_Disage.
C_WrkdWhenLim	Indicates whether sample person was working at time became disabled. Based on B22 and C_AdultChildOnset.
C_EvrWorked	Indicates whether sample person ever worked at time of interview. Based on B36, B22, B24, and B30.
C_HrPayNeeded	Hourly pay respondent reports needing to make to accept Job. Based on B29_3a and B29_3ahop, or B29_3b and B29_3bhop, or B29_8a and B29_8ahop, or B29_8b and B29_8bhop, or B29_12a and B29_12ahop.
C_MainConICD9_1	ICD-9 code assigned to verbatim response to B2 (main reason limited). Note: when an ICD-9 code could not be assigned, a two digit code corresponding to the ICD-9 chapter headings was assigned.
C_MainConDiagGrp_1-_8	ICD-9 diagnosis categories based on verbatim at B2 (physical or mental condition that is main reason limited).
C_MainConColDiagGrp_1-_8	Collapsed ICD-9 diagnosis categories based on verbatim at B2 (physical or mental condition that is main reason limited).
C_MainConBodyGroup_1-_8	ICD-9 body group categories based on verbatim at B2 (main reason limited).
C_SeconICD9_1-_12	ICD-9 code assigned to verbatim at B4 (other physical or mental conditions that limit work or other daily activities can do). Note: when and ICD-9 code could not be assigned, a two digit code corresponding to an ICD-9 chapter heading was assigned.
C_SeconDiagGrp_1-_12	ICD-9 diagnosis categories based on verbatim at B4 (other physical and mental conditions that limit work or daily activities).
C_SeconColDiagGrp_1-_12	Collapsed ICD-9 diagnosis categories based on verbatim at B4 (other physical and mental conditions that limit work or daily activities).
C_SeconBodyGroup_1-_12	ICD-9 body group categories based on verbatim at B4 (other physical or mental conditions that limit work or daily activities).
C_ReasBecEligICD9	ICD-9 code assigned to response indicating main reason eligible for disability benefits. Taken from B6, B12, or B15. Note: when and ICD-9 code could not be assigned, a two digit code corresponding to an ICD-9 chapter heading was assigned.
C_ReasBecEligDiagGrp	ICD-9 diagnosis categories for main reason eligible for disability benefits. Taken from B6, B12, or B15.
C_ReasBecEligColDiagGrp	Collapsed ICD-9 diagnosis categories for main reason eligible for disability benefits. Taken from B6, B12, or B15.
C_ReasBecEligBodyGroup	ICD-9 body group categories for main reason eligible for disability benefits. Taken from B6, B12, or B15.
Section C Variables: Current Employment	
C_MainCurJobHrPay	Hourly rate at current main job (pre-tax). Based on C10, C11, C12amt, and C12hop.

Appendix G (continued)

Variable Name	Description
C_MainCurJobMnthPay	Monthly pay rate at current main job (pre-tax). Based on C10, C11, C12amt, and C12hop.
C_MainCurJobMnthPayTH	Monthly take home pay from current main job. Based on C10, C11, C13amt, and C13hop.
C_MainCurJobSOC	SOC code assigned to verbatim from C2 (current occupation for main job).
C_MainCurJobNAICS	NAICS code assigned to verbatim at C3 (current industry for main job).
C_MainCurJobRepSSA	Number of months before current job reported to SSA. Based on C5b, C5month, and C5bweek.
C_MnthsMainCurJob	Months employed at current main job. Based on year of interview, C4mth, and C4yr. Computed for each job listed.
C_CurJob2HrPay	Hourly pay at current second job
C_CurJob2MnthPay	Monthly pre-tax pay at current second job.
C_CurJob2MnthPayTH	Monthly take home pay at current second job.
C_CurJob2SOC	SOC code assigned to verbatim from C2 (current occupation for second job).
C_CurJob2NAICS	NAICS code assigned to verbatim at C3 (current industry for second job).
C_CurJob2RepSSA	Number of months before current second job reported to SSA. Based on C5b, C5month, and C5bweek.
C_MnthsCurJob2	Months employed at current second job. Based on year of interview, C4mth, and C4yr.
C_CurJob3HrPay	Hourly pay at current third job
C_CurJob3MnthPay	Monthly pre-tax pay at current third job.
C_CurJob3MnthPayTH	Monthly take home pay at current third job.
C_CurJob3SOC	SOC code assigned to verbatim from C2 (current occupation for third job).
C_CurJob3NAICS	NAICS code assigned to verbatim at C3 (current industry for third job).
C_CurJob3RepSSA	Number of months before current third job reported to SSA. Based on C5b, C5month, and C5bweek.
C_MnthsCurJob3	Months employed at current third job. Based on year of interview, C4mth, and C4yr.
C_CurJob4HrPay	Hourly pay at current fourth job
C_CurJob4MnthPay	Monthly pre-tax pay at current fourth job.
C_CurJob4MnthPayTH	Monthly take home pay at current fourth job.

Appendix G (continued)

Variable Name	Description
C_CurJob4SOC	SOC code assigned to verbatim from C2 (current occupation for fourth job).
C_CurJob4NAICS	NAICS code assigned to verbatim at C3 (current industry for fourth job).
C_CurJob4RepSSA	Number of months before current fourth job reported to SSA. Based on C5b, C5month, and C5bweek.
C_MnthsCurJob4	Number of months before current fourth job reported to SSA. Based on C5b, C5month, and C5bweek.
C_TotCurMnthPay	Total current monthly pay from all jobs combined. Summary of currently monthly pay variables.
C_TotCurWkHrs	Total number of hours work per week on all current jobs combined. Based on summary of C8 for all jobs listed.
C_TotCurHrMnth	Total number of hours worked per month on all jobs combined. Based on summary of C8 for all jobs listed.
C_CurMnthEquipExp	Total current monthly expenses for equipment that helps work. Based on amount self/family pays reported in C26amt and C26hop.
C_CurMnthPASExp	Total current monthly expenses for personal assistance services that help work. Based on amount self/family pays reported in C31amt and C31hop.
C_TotCurEquipPASExp	Total expenses for equipment and personal assistance services that help work combined. Based on summary of C_MnthEquipExp and C_MnthPASExp.
c_totcurmnthpay_high	Flags cases where total monthly pay is higher than \$10,000.
c_totcurmnthpay_low	Flags cases where total monthly pay is less than \$20 a month.

Section D Variables: Jobs/Other Jobs During 2009

Main_Job_grid_num	Indicates which job is listed as 2009 main job.
C_job_from_SecC_1	Indicates which current job from section C has been copied over to job 1 in list of jobs held during 2009.
C_job_from_SecC_2	Indicates which current job from section C has been copied over to job 2 in list of jobs held during 2009.

C_Cohab	Indicates that sample member lives with spouse or partner. Based on L8, L9, and L10.

SSA Administrative Variables

OrgSampInfo_PrimDiagT16	SSA impairment code. From SSA administrative records.
OrgSampInfo_PrimDiagT2	SSA impairment code. From SSA administrative records.
OrgSampInfo_SecDiagT16	SSA impairment code. From SSA administrative records.

Appendix G (continued)

Variable Name	Description
OrgSampInfo_SecDiagT2	SSA impairment code. From SSA administrative records.
OrgSampInfo_hispanic	Indicates whether sample member hispanic or non-hispanic. Based on ethnicity from SSA administrative records.
OrgSampInfo_race	Race of sample member. From SSA administrative records.
OrgSampInfo_Sex	Sex of Sample member. From SSA administrative records.
N_SSIlastMnth	SSI Benefit Paid month before interview
N_DepenLastMnth	Dependent Payment Amount month before interview
N_SSDIlastMnth	Federal SSDI Benefit Paid month before interview
N_TotSSbenLastMnth	Total Benefits for the Month Before the Interview date
N_BenAbsOfEarn_Atint	Benefits in the absence of earnings at interview. Based on FAMTyymm, SAMTyymm, EICMyymm, DBENyymm.
N_Depen_Atint	SSA dependent benefit amount at interview. Based on PBENyymm.
N_MCAID_Atint	SSI Medicaid Eligibility Status At time of Interview (based on SSA admin data)
N_MCARE_Atint	SSDI Medicare Eligibility Status at time of Interview (based on SSA admin data)
N_MnthsLngstTTWProv2009	Months with longest TTW provider in 2009
N_NumTTWProv2009	Total number of TTW providers in 2009
N_SSDI_Atint	Federal SSSDI Benefit Paid at interview. Based on DBENyymm.
N_SSI_Atint	State and Federal SSI Benefit Paid month at interview. Based on SBENyymm
N_TTWmthsAssgnTkt	Number of months since TTW ticket first assigned
N_TTWPart2002	TTW Participant in year 2002. Based on active Moyymm.
N_TTWPart2009	TTW Participant in year 2009. Based on active Moyymm.
N_TTWPart2009	TTW Participant in year 2009. Based on active Moyymm.
N_TTWPart2009	TTW Participant in year 2009. Based on active Moyymm.
N_TTWPartEver	By time of Interview, TTW Participant ever. Based on active_MOyymm.
N_TTWPart_Atint	TTW participant at interview
N_TTWpmtTypLngst2009	Longest TTW PAYMENT type by end of 2009 for TTW participants as indicated by flagparti. Based on provtypen, tktpmttypn, TktAsgnDdtn, tktUnasgDtn.
N_TTWProvTypLngst2009	Longest TTW Provider type by end of 2009 for TTW participants as indicated by flagparti. Based on provtypen, tktpmttypn, TktAsgnDdtn, tktUnasgDtn

Appendix G (continued)

Variable Name	Description
N_TTWElig_Atint	TTW eligibility at month of interview
N_TTWMailed_Atint	TTW ticket mailed prior to (month before) interview month
N_TTWMnthsTktMail	Months from TTW ticket mail month until interview date
N_TTWMonEnrI03	Number of months enrolled in TTW in 2009
N_TTWMonEnrI04	Number of months enrolled in TTW in 2009
N_TTWMonEnrI05	Number of months enrolled in TTW in 2009
N_TTWMonEnrI_Atint	As of interview month, number of months enrolled in TTW. Based on active_Moyymm.
N_TTWUnAssignDate_Atnt	For former TTW participants (as of interview), last ticket unassignment date
N_TotSSBen_Atint	Total Benefits at Interview date
N_BenStatAtint2	Beneficiary status at Interview, if missing then at samp info used. Based on SSI0402-SSI0410, SSDI0402-SSDI410
N_SSDINoMcr_Atint	SSDI no Medicare at Interview. Based on SSDI0402-SSDI410, medr0402-medr410.
N_MthsEarlEnt	Months since earliest SSI or SSDI entitlement date by time of interview. Based on DOEI, MINGRD, T2begspan1-T2begspan12, T16begspan1-T16begspan22

VARIABLES RECODED FOR THE PUBLIC USE FILE

This page has been left blank for double-sided copying.

Variables Recoded for the Public Use File

Variable Name	Description of Recode
Caseid_PUB	Caseid assigned that cannot be linked across survey rounds.
R4_A_PSU_PUB	Values scrambled for PUF
R4_C_Intage_PUB	Grouped by ranges of two years and top coded at 62 for PUF
R4_C_disage_I_PUB	Grouped by ranges (i.e. 1=1-4, 5=5-7, 8=8-10, etc.) and top coded at 53 for PUF.
B28b_PUB	Grouped by ranges (<10, 10-20, 21-30, and >30) for PUF.
R4_HrPayNeeded_PUB	Bottom coded at 5.5 and top coded at 25 for PUF.
R4_C_MainCurJobSOC_PUB	Recoded to two digits and "other" category created for sheltered workshop, management, business, computer/math, architecture/engineering, scientist, social service, legal, education, art/entertainment, healthcare, protective service, farming, construction, repair, and military professions.
R4_C_MainCurJobNAICS_PUB	Recoded to two digits. Agriculture, mining, utilities, and construction combined with manufacturing; information, finance, real estate, professional, management, admin, and education combined; and "other" category created for transportation and warehousing, arts/entertainment, accommodation and food, other services, and public administration.
R4_C_TotCurMnthPay_I_PUB	Bottom coded at 100 and top coded at 1,300 for PUF.
R4_C_MnthsMainCurJob_PUB	Bottom coded at 6 and top coded at 36 for PUF.
R4_C_MainCurJobRepSSA_PUB	Top coded at 4 for PUF.
R4_C_TotCurWkHrs_I_PUB	Bottom coded at 8 and top coded at 40 for PUF.
R4_C_TotCurHrMnth_I_PUB	Bottom code at 35 and top coded at 174 for PUF.
R4_D6yr_m_PUB	Main job held in 2009 computed by determining which job had most hours worked in 2009. Bottom coded at 2000 for PUF.
R4_D8yr_m_PUB	Main job held in 2009 computed by determining which job had most hours worked in 2009. No recode needed.
R4_D15_m_PUB	Main job held in 2009 computed by determining which job had most hours worked in 2009. No recode needed.
R4_D16_m_PUB	Main job held in 2009 computed by determining which job had most hours worked in 2009. Bottom coded at 8 and top coded at 40 for PUF.
R4_D17_m_PUB	Main job held in 2009 computed by determining which job had most hours worked in 2009. Bottom coded at 12 for PUF.
R4_D18_m_PUB	Main job held in 2009 computed by determining which job had most hours worked in 2009. No recode needed.

WEIGHT VARIABLES USED FOR CROSS- SECTIONAL ESTIMATES

Beneficiary sample: **Wtr4_ben**
 Participant sample: **Wtr4_par**
 Combined samples: **Wtr4_com**

NEST VARIABLES USED FOR CROSS- SECTIONAL ESTIMATES

A_STRATA

1. Clustered samples for both beneficiaries and participants
 - a. A_STRATA = 1000 for PSUs in Phase 1 states
 - b. A_STRATA = 2000 for PSUs in Phase 2 states
 - c. A_STRATA = 3000 for PSUs in Phase 3 states
2. Unclustered samples for participants
 - a. A_STRATA = 1410 nonSVRA EN participants in PSUs, Phase 1 states
 - b. A_STRATA = 1420 nonSVRA EN participants not in PSUs, Phase 1 states
 - c. A_STRATA = 1510 SVRA Acting as EN participants in PSUs, Phase 1 states
 - d. A_STRATA = 1520 SVRA Acting as EN participants not in PSUs, Phase 1 states
 - e. A_STRATA = 2410 nonSVRA EN participants in PSUs, Phase 2 states
 - f. A_STRATA = 2420 nonSVRA EN participants not in PSUs, Phase 2 states
 - g. A_STRATA = 2510 SVRA Acting as EN participants in PSUs, Phase 2 states
 - h. A_STRATA = 2520 SVRA Acting as EN participants not in PSUs, Phase 2 states
 - i. A_STRATA = 3410 nonSVRA EN participants in PSUs, Phase 3 states
 - j. A_STRATA = 3420 nonSVRA EN participants not in PSUs, Phase 3 states
 - k. A_STRATA = 3510 SVRA Acting as EN participants in PSUs, Phase 3 states
 - l. A_STRATA = 3520 SVRA Acting as EN participants not in PSUs, Phase 3 states

A_PSU

1. Clustered sample cases both beneficiaries and participants cross-sectional samples

A_PSU = PSU identifier

2. Unclustered sample cases in Milestone-outcome and Outcome-only Phase 2 participants and Outcome-only Phase 3 participants cross-sectional samples

A_PSU = MPR_ID

NOTES

1. Before each SUDAAN procedure, sort by A_STRATA and A_PSU
2. Use SUDAAN's SUBPOP statement to define population for which estimates are wanted.

For example, for estimates of SSI participant population, use SUBPOP to define SSI participants.
